

M. Tech. Degree
IN
COMMUNICATION SYSTEMS

**SYLLABUS
FOR
CREDIT BASED CURRICULUM**
(For students admitted in 2023)

**DEPARTMENT OF ELECTRONICS AND COMMUNICATION ENGINEERING
NATIONAL INSTITUTE OF TECHNOLOGY
TIRUCHIRAPPALLI – 620 015
TAMIL NADU, INDIA**

Institute Vision and Mission

Vision

- To be a university globally trusted for technical excellence where learning and research integrate to sustain society and industry.

Mission

- To offer undergraduate, postgraduate, doctoral and modular programmes in multi-disciplinary / inter-disciplinary and emerging areas.
- To create a converging learning environment to serve a dynamically evolving society.
- To promote innovation for sustainable solutions by forging global collaborations with academia and industry in cutting-edge research.
- To be an intellectual ecosystem where human capabilities can develop holistically.

Department Vision and Mission

Vision

- To excel in education and research in Electronics and Communication Engineering

Mission

- To educate with the state of art technologies to meet the growing challenges of the industry.
- To carry out research through constant interaction with research organizations and industry.
- To equip the students with strong foundations to enable them for continuing Education.

Program Educational Objectives (PEOs)

- **PEO1:** Graduates of the programme will be professional Telecommunication Engineers, Researchers, and Academicians with ethical and societal responsibility.
- **PEO2:** Graduates of the programme, as part of an organization, will continue to learn and handle cutting-edge technology.

Program Outcomes (POs)

- **PO1:** An ability to independently carry out research /investigation and development work to solve practical problems in communication systems.
- **PO2:** An ability to write and present a substantial technical report/document in communication systems.
- **PO3:** Students should be able to demonstrate mastery over communication systems. The mastery should be at a level higher than the requirements in the appropriate bachelor program.

CURRICULUM

The total minimum credits required for completing the M.Tech. Communication Systems Programme in Electronics and Communication Engineering is 66

SEMESTER I

| Sl. No. | CODE | COURSE OF STUDY | C |
|---------|-------|---|----|
| 1. | EC601 | Linear Algebra and Stochastic Processes | 3 |
| 2. | EC603 | Advanced Digital Signal Processing | 3 |
| 3. | EC605 | Microwave Circuits | 3 |
| 4. | | Elective – 1 | 3 |
| 5. | | Elective – 2 | 3 |
| 6. | | Elective – 3 | 3 |
| 7. | EC607 | Microwave and MIC Laboratory | 2 |
| TOTAL | | | 20 |

SEMESTER II

| Sl. No. | CODE | COURSE OF STUDY | C |
|---------|-------|--|----|
| 1. | EC602 | Advanced Digital Communication | 3 |
| 2. | EC604 | Broadband Wireless Technologies | 3 |
| 3. | EC606 | Optical Communication Systems | 3 |
| 4. | | Elective – 4 | 3 |
| 5. | | Elective – 5 | 3 |
| 6. | | Elective – 6 | 3 |
| 7. | EC608 | Fiber Optics and Communication Laboratory | 2 |
| 8. | EC610 | Digital Signal and Image Processing Laboratory | 2 |
| TOTAL | | | 22 |

SEMESTER III

| Sl. No | CODE | COURSE OF STUDY | C |
|--------|-------|-------------------|----|
| 1 | EC647 | Project – Phase I | 12 |
| TOTAL | | | 12 |

SEMESTER IV

| SL. No | CODE | COURSE OF STUDY | C |
|--------|-------|--------------------|----|
| 1 | EC648 | Project - Phase II | 12 |
| TOTAL | | | 12 |

LIST OF ELECTIVES

| Sl. No | CODE | COURSE OF STUDY | C |
|--------|-------|--|---|
| 1. | EC611 | Detection and Estimation | 3 |
| 2. | EC612 | DSP Architecture | 3 |
| 3. | EC613 | High Speed Communication Networks | 3 |
| 4. | EC614 | Spectral Analysis of Signal | 3 |
| 5. | EC615 | Digital Image Processing | 3 |
| 6. | EC616 | RF MEMS | 3 |
| 7. | EC617 | Smart Antennas | 3 |
| 8. | EC618 | Ad Hoc Networks | 3 |
| 9. | EC619 | Wavelet Signal Processing | 3 |
| 10. | EC620 | WDM Optical Networks | 3 |
| 11. | EC621 | Advanced Techniques for Wireless Reception | 3 |
| 12. | EC622 | Error Control Coding | 3 |
| 13. | EC623 | Digital Communication Receivers | 3 |
| 14. | EC624 | Analysis Methods for Passive MIC | 3 |
| 15. | EC625 | Electromagnetic Metamaterials | 3 |
| 16. | EC626 | Bio MEMS | 3 |

| | | | |
|-----|-------|--|---|
| 17. | EC627 | Substrate Integrated Waveguide Technology: Design and Analysis | 3 |
| 18. | EC628 | Pattern Recognition and Computational Intelligence | 3 |
| 19. | EC629 | Photonic Integrated Circuits | 3 |
| 20. | EC630 | Fiber-Optic Sensors | 3 |
| 21. | EC631 | Optical Wireless Communications | 3 |
| 22. | EC632 | Foundations of Artificial Intelligence | 3 |
| 23. | EC633 | Introduction to Soft Computing and Machine Learning | 3 |
| 24. | EC634 | Next Generation WLAN | 3 |
| 25. | EC635 | Electromagnetic Interference and Compatibility | 3 |
| 26. | EC636 | Computer Vision | 3 |
| 27. | EC637 | Natural Language Processing | 3 |
| 28. | EC638 | Optimization Methods in Machine Learning | 3 |
| 29. | EC639 | Hardware for Deep Learning | 3 |
| 30. | EC640 | Image and Video Processing | 3 |
| 31. | EC641 | Automated Test Engineering for Electronics | 3 |
| 32. | EC654 | Electronic Design Automation Tools | 3 |
| 33. | EC656 | Design of ASICs | 3 |
| 34. | EC662 | Modeling and Synthesis with Verilog HDL | 3 |
| 35. | EC663 | Optimization of Digital Signal Processing structures for VLSI | 3 |
| 36. | EC664 | Cognitive Radio | 3 |
| 37. | EC642 | Radiating Systems | 3 |
| 38. | EC643 | Advanced Topics in 5G/B5G Wireless Communication | 3 |
| 39. | EC644 | Fundamentals of MIMO Wireless Communications | 3 |
| 40. | EC645 | Evolution of Air Interface Towards 5G | 3 |

LIST OF OPEN ELECTIVES

| Sl. No | CODE | COURSE OF STUDY | C |
|---------------|-------------|--|----------|
| 1. | EC691 | Pattern Recognition and Computational Intelligence | 3 |
| 2. | EC692 | High Speed Communication Networks | 3 |
| 3. | EC693 | Electromagnetic Interference and Compatibility | 3 |

| | |
|--------------------------|--|
| Course Code | : EC601 |
| Course Title | : Linear Algebra and Stochastic Processes |
| Number of Credits | : 3 |
| Course Type | : Core |

COURSE OBJECTIVE

- The subject introduces the probability, random process and the linear algebra that are required for the theoretical analysis of the communication systems.

COURSE CONTENT

Vector spaces. Four fundamental vector spaces of the matrix. Rank-Nullity theorem. Projection theorem.- Linear transformation matrix with different basis- Gram-Schmidt orthogonalization procedure. QR factorization. Eigen values and Eigen vectors. Diagonalization of the matrix. Schur's lemma. Hermitian Matrices- Unitary Matrices - Normal Matrices. Singular Value Decomposition.

Probability spaces. Random variables and random vectors. Distributions and densities-Conditional distributions and densities. Independent random variables. Transformation of random variables

Expectations. Indicator. Moment generating function. Characteristic function. Multiple random variable. Gaussian random vector. Co-variance matrix. Complex random variables. Sequence of random variable- Central limit theorem.

Strictly stationary random process. Wide sense stationary random process. Complex random process. Jointly strictly and wide sense stationary of two random processes. Correlation matrix obtained from random process. Ergodic process. Independent random process. Uncorrelated random process. Random process as the input and output of the system. Power spectral density.

White random process. Gaussian random process. Cyclo-stationary random process. Wide sense cyclo stationary random process. Sampling and reconstruction of random process. Band pass random process. Applications of Linear algebra and Stochastic process for telecommunication.

Text Books

- R.B.Ash & C.Doleans-Dade, "Probability and Measure Theory (2/e)", Elsevier, 2005*
- A.Papoulis, S.U.Pillai, "Probability, Random variables and Stochastic processes" 4th edition Tata-Mc Hill (4/e), 2001*
- G.Strang, "Linear Algebra", Thomson Brooks/Cole Cengage Hill (4/e), 2006*

Reference Books

- Stakgold, I., Green's "Functions and Boundary value Problems (e)", Wiley, 1998*
- E.S.Gopi, "Mathematical summary for digital signal processing applications with Matlab", Springer, 2011.*
- E.Wong & B.Hajek, "Stochastic Processes in Engineering systems", Springer, 1985.*
- R.B.Ash & W.A.Gardner, "Topics in stochastic processes", Academic Press, 1975.*
- Recent literature in Linear Algebra and Stochastic Processes.*

COURSE OUTCOMES

Students are able to

CO1: solve the problems associated with Linear algebra

CO2: solve the problem associated with transformation of random variables

CO3: summarize the concepts associated with multiple random variables and to solve the problems associated with Multivariate Gaussian random vector

CO4: summarize the concepts associated with random process and to compute the power spectral density of the output of the system.

CO5: recognize the usage of random process in telecommunication engineering and to solve the corresponding problems.

| | | |
|--------------------------|----------|---|
| Course Code | : | EC603 |
| Course Title | : | Advanced Digital Signal Processing |
| Number of Credits | : | 3 |
| Course Type | : | Core |

COURSE OBJECTIVE

- To provide rigorous foundations in multirate signal processing, power spectrum estimation and adaptive filters.

COURSE CONTENT

Review of sampling theory. Sampling rate conversion by integer and rational factors. Efficient realization and applications of sampling rate conversion.

Wiener filtering. Optimum linear prediction. Levinson- Durbin algorithm. Prediction error filters.

Adaptive filters. FIR adaptive LMS algorithm. Convergence of adaptive algorithms. Fast algorithms. Applications: Noise canceller, echo canceller and equalizer.

Recursive least squares algorithms. Matrix inversion lemma. Convergence analysis of the RLS algorithm. Adaptive beam forming. Kalman filtering.

Spectrum estimation. Estimation of autocorrelation. Periodogram method. Nonparametric methods. Parametric methods.

Text Books

1. J.G.Proakis, M. Salehi, "Advanced Digital Signal Processing", McGraw –Hill, 1992.
2. S.Haykin, "Adaptive Filter Theory (3/e)", Prentice- Hall, 1996.

Reference Books

1. D.G.Manolakis, V. K. Ingle, and S. M. Kogon , "Statistical and Adaptive Signal Processing", McGraw-Hill, 2005
2. S.L.Marple, "Digital Spectral Analysis", 1987.
3. M.H.Hays, " Statistical Digital Signal Processing and Modeling", John-Wiley, 2001.
4. Recent literature in Advanced Digital Signal Processing.

COURSE OUTCOMES

Students are able to

- CO1: apply multirate DSP for applications and design efficient digital filters & construct multi-channel filter banks.
- CO2 select linear filtering techniques to engineering problems.
- CO3: describe the most important adaptive filter generic problems.
- CO4: describe the various adaptive filter algorithms.
- CO5: describe the statistical properties of the conventional spectral estimators.

| | | |
|--------------------------|----------|---------------------------|
| Course Code | : | EC605 |
| Course Title | : | Microwave Circuits |
| Number of Credits | : | 3 |
| Course Type | : | Core |

COURSE OBJECTIVE

- To make the students familiarize with ABCD parameters, S parameters, Applications of planar transmission lines in the practical microwave circuits, Design and layout of all Microwave Integrated Circuit Design components and then systems.

COURSE CONTENT

Introduction and application of microwave circuits - Two-port network characterization. ABCD parameters, Conversion of S matrix in terms of ABCD matrix. Scattering matrix representation of microwave components. Review of Smith chart and its application- Impedance matching using Lumped and Distributed approach.

Microwave Passive circuit design: Characteristics, properties, design parameters and applications- Design and realization of MIC Power dividers. 3 dB hybrid design. Directional Coupler design- Hybrid ring design.

Microwave filter design- Filter design by insertion loss method –Richards and Kuroda transformation. K inverter, J inverter. Resonator filters. Realization using microstrip lines and strip lines.

Microwave amplifier design- Power gain equations -Stability considerations. Maximum gain design, Design for specific gain -Low Noise Amplifier Design. High power design.

Microwave oscillator design. One – port and two – port negative resistance oscillators and oscillator design

Text Books:

1. Reinhold Ludwig, *RF circuit design, 2nd edition, Prentice Hall 2014, ISBN: 978-0131471375*
2. David. M. Pozar, *Microwave engineering, 4th edition, John Wiley, 2011, ISBN: 978-0470631553.*
3. Devendra K. Misra, “*Radio-Frequency and microwave communication circuits analysis and design*”, 2nd edition, University of Wisconsin-Mulwaukee, A John Wiley & Sons Publication

Reference Books:

1. B. Bhat, S. K Koul, “*Stripline like transmission lines for Microwave Integrated Circuits*”, New Age International Pvt. Ltd Publishers, 2007.
2. I.J.Bahl & P.Bhartia, “*Microwave Solid state Circuit Design (2/e)*”, Wiley, 2003.
3. Matthew M. Radmanesh, *Radio Frequency and Microwave Electronics Illustrated, Prentice Hall, 2012*
4. S.Y.Liao, “*Microwave Circuit Analysis and Amplifier Design*”, Prentice-Hall, 1986.
5. G. Mathaei, L young, E.M.T. Jones, “*Microwave filters, Impedance-Matching networks and Coupling structures*”, Artech House Books.

COURSE OUTCOMES

Students are able to

- CO1: Understand the basics of Scattering matrix and two port characterization and importance of matching circuits.
- CO2: Analyze the working principles of couplers, power dividers etc. and their design.
- CO3: Design the different types of MIC filters and their implementation.
- CO4: Understand the complexities of microwave amplifier design and its stability features.
- CO5: Analyze and appreciate the design principles of microwave oscillators.

| | | |
|--------------------------|----------|-------------------------------------|
| Course Code | : | EC607 |
| Course Title | : | Microwave and MIC Laboratory |
| Number of Credits | : | 2 |
| Course Type | : | Laboratory |

List of Experiments:

1. Characteristics of Reflex Klystron
2. Characteristics of Gunn diode
3. Impedance Measurement
4. Frequency and Wavelength Measurement
5. Characteristics of Branch line directional coupler
6. Study of 3dB power divider
7. Study of Rat-race Hybrid ring
8. Study of Filters
9. Antenna Measurements
10. Study of 50Ω Microstrip Line
11. Study of Parallel line directional coupler

COURSE OUTCOMES

At the end of the course students are able to do

- CO1: Design and measure the parameters of MIC components
- CO2: Design and measure the parameters of MIC filters
- CO3: Design and simulate the planar antennas using CAD tools
- CO4: Measure the characteristics of Microwave sources
- CO5: Design and measure the parameters of planar antennas

| | | |
|--------------------------|----------|---------------------------------------|
| Course Code | : | EC602 |
| Course Title | : | Advanced Digital Communication |
| Number of Credits | : | 3 |
| Course Type | : | Core |

COURSE OBJECTIVE

- This subject gives an in depth knowledge and advancement in digital communication systems. It introduces some of the upcoming technologies like Multiuser - communication, Multi channel and Multicarrier communication technologies.

COURSE CONTENT

Baseband data transmission- Nyquist criterion for zero ISI, Correlative level coding, Optimum design of transmit and receive filters, Equalization.

Passband Digital transmission- Digital modulation schemes, Carrier synchronization methods, Symbol timing estimation methods.

Error control coding - Linear block codes, cyclic codes-encoding and decoding, Non-binary codes, Convolutional codes, Decoding of convolutional codes, Trellis coded modulation, Interleaver, Turbo coding, Performance measures.

Spread spectrum communication- D S and F H spread spectrum, CDMA system based on FH and DS spread spectrum signals, Applications, Synchronization of spread spectrum signals.

Multichannel and Multicarrier communication Systems, Multi user communication systems.

Text Books

1. *J.G.Proakis, " Digital Communication (4/e)", McGraw- Hill, 2001*
2. *S. Haykin, "Communication systems (4/e)", John Wiley, 2001*
3. *B.P. Lathi, Zhi Ding, "Modern Digital and Analog Communication Systems (4/e)", Oxford university Press, 2010*

Reference Book

1. *S.Lin & D.J.Costello, Error Control Coding (2/e) Pearson, 2005*
2. *Recent literature in Advanced Digital Communication.*

COURSE OUTCOMES

At the end of course student will be able to

- CO1: Understand the operation, theoretical analysis and design of baseband, passband data transmission systems.
- CO2: Design and implement various error control codes.
- CO3: Summarize spread spectrum technology and its application.
- CO4: Compare single carrier and multicarrier communication systems.
- CO5: Do research in the digital communication systems.

| | | |
|--------------------------|----------|--|
| Course Code | : | EC604 |
| Course Title | : | Broadband Wireless Technologies |
| Number of Credits | : | 3 |
| Course Type | : | Core |

COURSE OBJECTIVE

- To expose the students to understand mobile radio communication principles and to study the recent trends adopted in cellular systems and wireless standards.

COURSE CONTENT

Introduction to Wireless Communication. The Cellular concept, System design, Capacity improvement in cellular systems, Co channel interference reduction. Intelligent cell concept and applications. Technical Challenges.

Mobile radio propagation: Reflection, Diffraction. Outage probability under path loss and Shadowing. Calculation of boundary coverage and area coverage. Practical link budget design using path loss models.

Fading. Multipath Propagation. Parameters of mobile multipath channels. Statistical Channel models, Diversity Schemes and Combining Techniques. Design parameters at the base station. RAKE receiver.

Multiuser Systems: CDMA- Principle, Network design, Link capacity, Power control. WCDMA-Network planning, MC-CDMA, OFDM, Cellular mobile communication beyond 3G.

Wireless Systems and Standards. Ultra-wideband communications. Smart antenna systems, Beam forming. MIMO Systems. Massive MIMO. 4G and beyond 4G. NOMA and 5G.

Text Books

- A.F.Molisch, Wireless Communications, Wiley, 2005.*
- A.Goldsmith, Wireless Communications, Cambridge University Press, 2005.*

Reference Books

- P. Muthu Chidambara Nathan, "Wireless Communications", PHI, 2013.*
- D.Tse, P.Viswanath, "Fundamentals of Wireless Communication", Cambridge University Press, 2005.*
- S.G. Glisic, "Advanced Wireless Communications", 4G Technologies, Wiley, 2004.*
- W. C. Y.Lee, "Mobile Communication Engineering", (2/e), McGraw- Hill, 1998.*
- Gordon L.Stubder, "Principles of Mobile Communication", 3rd edition, Springer, 2013.*
- Recent literature in Broadband Wireless Technologies.*

COURSE OUTCOMES

Students are able to

CO1: discuss the cellular system design and technical challenges.

CO2: analyze the Mobile radio propagation, and practical link budget design.

CO3: analyze fading, diversity concepts, channel models, and design parameters.

CO4: analyze Multiuser Systems, CDMA, WCDMA network planning and OFDM Concepts.

CO5: summarize the principles and applications of wireless systems and standards, smart antenna, beam forming and MIMO systems.

| | | |
|--------------------------|----------|--------------------------------------|
| Course Code | : | EC606 |
| Course Title | : | Optical Communication Systems |
| Number of Credits | : | 3 |
| Course Type | : | Core |

COURSE OBJECTIVES

- To prepare the students understand the various process and subsystems involved in the optical communication.
- To enable the students appreciate the different multiplexing technologies in the fiber optic communication.
- To design optical communication systems to serve a defined purpose

COURSE CONTENT

Fundamentals of coherent systems: Basic concepts. Modulation and demodulation schemes. System performance.

Semiconductor optical amplifiers. EDFA and Raman amplifiers – modeling and analysis. Analysis and digital transmission with high power fiber amplifiers.

Multichannel systems: WDM light wave systems. TDM and code division multiplexing.

Advances in wavelength division multiplexing / demultiplexing technologies.

SONET/SDH, ATM, IP, storage area networks. Wavelength routed networks. Next generation optical Internets.

Soliton systems: Nonlinear effects. Soliton – based communication. High speed and WDM soliton systems

Text Books

1. G.P.Agrawal, “Fiber Optic Communication Systems (4/e)”, Wiley, 2010
2. B.P.Pal , “Guided Wave Optical Components and Devices”, Elsevier , 2006

Reference Books

1. C.S.Murthy & M.Gurusamy, “WDM Optical Networks”, PHI, 2002
2. R.Ramaswami, K.N. Sivarajan, “Optical Networks”, (2/e), Elsevier, 2002.
3. G.P.Agrawal, “Non linear Fiber Optics”, (4/e), Elsevier, 2010
4. A Selvarajan, S. Kar, T. Srinivas, “Opticl fiber communication principles and systems”, Tata McGraw Hill, 2005.
5. Recent literature in Optical Communication Systems.

COURSE OUTCOMES

Students are able to

CO1: understand the modulation and demodulation schemes in the coherent optical systems.

CO2: understand the various types of the optical amplifiers

CO3: analyse various multiplexing techniques used and evaluate the recent advances in this field

CO4: compare the merits and demerits, potential applications of microwave semiconductor devices.

CO5: analyse the operating principle of WDM solutions systems.

| | | |
|--------------------------|----------|--|
| Course Code | : | EC608 |
| Course Title | : | Fiber Optics and Communication Laboratory |
| Number of Credits | : | 2 |
| Course Type | : | Laboratory |

List of Experiments

1. Measurement of Numerical Aperture in Optical Fiber
2. Measurement of Attenuation and Bending Loss in Optical Fiber
3. BER and Q-factor Estimation in Optical System Simulation
4. Characterization of Erbium Doped Fiber Amplifier
5. Wavelength Division Multiplexing Link
6. Four Wave Mixing Nonlinear Effect in Optical Fiber
7. Characteristics of AWGN and BSC Channels
8. Digital Modulation Schemes
 - a. BPSK Modulator and Demodulator
 - b. 16-Quadrature Amplitude Modulator and Demodulator
9. Error Control Codes
 - a. Convolutional Encoder and Decoder
 - b. Cyclic Encoder and Decoder
10. Path Loss in Wireless Propagation Models
11. Rayleigh and Rician Fading Channels
12. OFDM-802.11a
13. Study Experiments:
 - a. Analog and Voice Communication through Optical Link
 - b. Sampling and Reconstruction Technique
 - c. Wireless Digital Communication System using Wicomm-T

COURSE OUTCOMES

At the end of course student will be able to

- CO1: Understand the basic concepts and advancements in fiber optic technology and wireless communication systems.
- CO2: Understand the channel characteristics of fiber optics and wireless communication systems and the concept of the optical amplifier.
- CO3: Demonstrate the digital modulation schemes and error control coding techniques.
- CO4: Interpret the fiber optic and wireless communication system models by using the simulation software.
- CO5: Analyze the operating principle of WDM solutions systems and the effect of nonlinearity in optical fiber.

| | | |
|--------------------------|----------|---|
| Course Code | : | EC610 |
| Course Title | : | Digital Signal and Image Processing Laboratory |
| Number of Credits | : | 2 |
| Course Type | : | Laboratory |

List of Experiments:

1. Generation of spatially correlated multivariate Gaussian process with desired mean vector and the required co-variance matrix.
2. Forward linear predictor and backward linear predictor
3. Design and realization of the adaptive filter using LMS algorithm and RLS algorithm
4. Noise cancellation using Winner filter and adaptive filter
5. Performance study of periodogram power spectrum estimator and modified periodogram estimator
6. Nonparametric and methods of power spectrum estimator (Bartlett;s and Welch’s methods)
7. AR method of power spectrum estimation
8. (A) Transmultiplexer
(B) Quadrature –mirror filter
9. Representation of the 2D image signal as the linear combinations of PCA (Eigen faces)
10. Image compression using discrete cosine transformation (DCT).
11. Discrete Multitone Transmission (DMT)
12. Orthogonal Frequency-division multiplexing (OFDM)
13. Implementation of Multiple-input Multiple output (MIMO)
14. Speech recognition using Support Vector Machine (SVM)
15. Study of wireless-telecommunication using Wicomm-T, Wireless digital communication system SDR platform.

COURSE OUTCOMES

Students are able to

- CO1: design simple adaptive filters
- CO2: study the performance of periodogram power spectrum estimator
- CO3: learn basic image processing transforms
- CO4: learn basic image processing techniques to improve the quality of image

| | |
|--------------------------|-----------------------------------|
| Course Code | : EC611 |
| Course Title | : Detection and Estimation |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- The objective of this course is to make the students conversant with those aspects of statistical decision and estimation which is indispensable tools required for the optimal design of digital communication systems.

COURSE CONTENT

Binary hypothesis testing; Bayes, mini- max and Neyman-Pearson tests. Composite hypothesis testing.

Signal detection in discrete time: Models and detector structures. Coherent detection in independent noise. Detection in Gaussian noise. Detection of signals with random parameters. Detection of stochastic signals. Performance evaluation of signal detection procedures.

Bayesian parameter estimation; MMSE, MMAE and MAP estimates. Nonrandom parameter estimation. Exponential families. Completeness theorem. ML estimation. Information inequality. Asymptotic properties of MLEs.

Discrete time Kalman- Bucy filter. Linear estimation. Orthogonality principle. Wiener- Kolmogorov filtering – causal and non -causal filters.

Signal detection in continuous time: Detection of deterministic signals in Gaussian noise. Coherent detection in white Gaussian noise.

Text Books

- H.V.Poor, "An Introduction to Signal Detection and Estimation (2/e) Springer", 1994.*
- B.C.Levy, "Principles of Signal Detection and Parameter Estimation, Springer", 2008.*

Reference Books

- H.L.Vantrees, "Detection, Estimation and Modulation theory", Part I, Wiley, 1987.*

- J.C.Hancock & P.A. Wintz, "Signal Detection Theory", Mc-Graw Hill, 1966.*
- Recent literature in Detection and Estimation.*

COURSE OUTCOMES

Students are able to

- CO1: summarize the fundamental concept on Statistical Decision Theory and Hypothesis Testing
 CO2: summarize the various signal estimation techniques with additive noise
 CO3: summarize with Bayesian parameter estimation (minimum mean square error (MMSE), minimum mean absolute error (MMAE), maximum a-posterior probability (MAP) estimation methods).
 CO4: compare optimal filtering, linear estimation, and Wiener/Kalman filtering.
 CO5: construct Wiener and Kalman filters (time discrete) and state space models.

| | |
|--------------------------|---------------------------|
| Course Code | : EC612 |
| Course Title | : DSP Architecture |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVES

- To give an exposure to the various fixed point and floating point DSP architectures and to implement real time applications using these processors.

COURSE CONTENT

Fixed-point DSP architectures. TMS320C54X, ADSP21XX, DSP56XX architecture details. Addressing modes. Control and repeat operations. Interrupts. Pipeline operation. Memory Map and Buses. TMS320C55X architecture and its comparison.

Floating-point DSP architectures. TMS320C67X, DSP96XX architectures. Cache architecture. Floating-point Data formats. On-chip peripherals. Memory Map and Buses.

On-chip peripherals and interfacing. Clock generator with PLL. Serial port. McBSP. Parallel port. DMA. EMIF. Serial interface- Audio codec. Sensors. A/D and D/A interfaces. Parallel interface- RAM and FPGA. RF transceiver interface.

DSP tools and applications. Implementation of Filters, DFT, QPSK Modem, Speech processing. Video processing, Video Encoding / Decoding. Biometrics. Machine Vision. High performance computing (HPC).

Digital Media Processors. Video processing sub systems. Multi-core DSPs. OMAP. CORTEX, SHARC, SIMD, MIMD Architectures.

Text Books

1. *B.Venkataramani&M.Bhaskar, "Digital Signal Processor, Architecture, Programming and Applications", (2/e), McGraw- Hill, 2010*
2. *S.Srinivasan&Avtar Singh, "Digital Signal Processing, Implementations using DSP Microprocessors with Examples from TMS320C54X", Brooks/Cole, 2004*

Reference Books

3. *S.M. Kuo&B.H.Lee, "Real-Time Digital Signal Processing, Implementations, Applications and Experiments with the TMS320C55X", John Wiley, 2001.*
4. *Recent literature in DSP Architecture.*

COURSE OUTCOMES

Students are able to

CO1: learn the architecture details fixed and floating point DSPs

CO2: infer about the control instructions, interrupts, and pipeline operations, memory and buses.

CO3: illustrate the features of on-chip peripheral devices and its interfacing with real time application devices.

CO4: learn to implement the signal processing algorithms and applications in DSPs.

CO5: learn the architecture of advanced DSPs.

| | |
|--------------------------|--|
| Course Code | : EC613 |
| Course Title | : High Speed Communication Networks |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

To impart the students a thorough exposure to the layered architecture of communication network and to analyse the protocols adopted for traffic management, routing and QOS provisioning.

COURSE CONTENT

The need for a protocol architecture, The TCP/IP protocol architecture, Internetworking, Packet switching networks, Frame relay networks, Asynchronous Transfer mode (ATM) protocol architecture, High speed LANs.

Application of queuing theory to the analysis of performance of communication networks, Transport layer services-Principles of Reliable data transfer, Congestion control and flow control mechanism.

Virtual circuits and datagrams, Router architecture, Forwarding and addressing in the internet, Interior routing protocols, Exterior routing protocols and multicast.

IEEE 802.11 architecture and services, medium access control and physical layer, Wi-Fi protected access, IEEE 802.15 protocol architecture, Blue tooth and Personal Area Networks.

Quality of service in IP networks, Integrated and differentiated services, Protocols for QOS support-Resource reservation protocol, Multiprotocol label switching, Real time transport protocol. Simulation study on QoS provisioning in IP network.

Text Books

1. *W.Stallings, "High speed networks and internets" 2nd edition, Pearson education, 2002.*
2. *W. Stallings, "Wireless communication and networks" 2nd edition, Pearson publication, 2013.*
3. *J.F.Kurose and K.W.Ross", Computer networking" 3rd edition, Pearson education, 2005.*

Reference Books

1. *M. Schwartz, "Telecommunication networks, protocols, modelling and analysis", Pearson education, 2004*
2. *Jean walrand and Praveen Varaiya, " High performance communication networks", 2nd edition, Morgan Kaufmann publishers, 2005.*
3. *Saadawi, Ammar and El Hakeem, "Fundamentals of telecommunication Networks", Wiley series in Telecommunications and signal processing, 1994.*

COURSE OUTCOMES

Students are able to

CO1: compare and analyse the fundamental principles of various high speed communication networks and their protocol architectures

CO2: examine the performance modeling, congestion control issues and traffic management in IP networks

CO3: compare and analyse the various routing protocols in IP networks

CO4: study of various wireless LAN standards, Blue tooth and high data rate personal area networks

CO5: examine quality of service in IP networks.

| | |
|--------------------------|---------------------------------------|
| Course Code | : EC614 |
| Course Title | : Spectral Analysis of Signals |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To give an exhaustive survey of methods available for power spectrum estimation.

COURSE CONTENT

Periodogram and correlogram. Blackman – Tukey, Bartlett, Welch and Daniel methods. Window design considerations.

Parametric methods for rational spectra. Covariance structure of ARMA processes. AR, MA and ARMA signals. Multivariate ARMA signals.

Parametric methods for line spectra. Models of sinusoidal signals in noise. Nonlinear least squares, high order Yule-Walker, min-norm, Pisarenko, MUSIC and ESPRIT methods.

Filter bank methods. Filter-bank interpretation of the periodogram. Refined filter-bank and Capon methods.

Spatial methods. Array model. Nonparametric methods; beam forming and Capon method. Parametric methods; nonlinear least squares, Yule-Walker, min-norm, Pisarenko, MUSIC and ESPRIT methods.

Text Books

1. *P.Stoica & R.Moses, "Spectral Analysis of signals", Pearson, 2005.*
2. *Marple, "Introduction to Spectral Analysis", Prentice Hall.*

Reference Book

1. *S.M.Key, "Fundamentals of Statistical Signal Processing", Prentice Hall PTR, 1998.*
2. *Recent literature in Spectral Analysis of signals.*

COURSE OUTCOMES

Students are able to

- CO1: derive and analyse the statistical properties of the conventional spectral estimators, namely the periodogram, averaged & modified periodogram and Blackman-Tukey methods.
- CO2: formulate modern, parametric, spectral estimators based upon autoregressive (AR), moving average (MA), and autoregressive moving average (ARMA) models, and detail their statistical properties. Describe the consequence of the term resolution as applied to a spectral estimator.
- CO3: define techniques for calculating moments in spectral and temporal domains; Analyze filter bank method, capon methods for spectrum estimation.
- CO4: demonstrate knowledge and understanding of the principles of parametric and non-parametric array processing algorithms.
- CO5: select an appropriate array processing algorithms for frequency estimation and sonar, radar applications.

| | |
|--------------------------|-----------------------------------|
| Course Code | : EC615 |
| Course Title | : Digital Image Processing |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVES

- To explore various techniques involved in Digital Image Processing.

COURSE CONTENT

Elements of Visual perception. Image sensing and Acquisition. Imaging in different bands. Digital Image Representation. Relationship between pixels. Image transformations: 2D-DFT, DCT, DST, Hadamard, Walsh, Hotelling transformation, 2D-Wavelet transformation, Wavelet packets.

Image Enhancements in spatial domain and Frequency domain. Image Restoration techniques. Color Image processing.

Error free compression: Variable length coding, LZW, Bit-plane coding, Lossless predictive coding
Lossy compression: Lossy predictive coding, transform coding, wavelet coding. Image compression standards (CCITT, JPEG, JPEG 2000) and Video compression standards.

Summary of morphological operations in Binary and Gray Images. Image segmentation: Point, Line and Edge segmentation. Edge linking and Boundary detection. Segmentation using thresholding, Region based segmentation. Segmentation by morphological watersheds. Use of motion in segmentation.

Feature Extraction from the Image: Boundary descriptors, Regional descriptors, Relational descriptors. Dimensionality reduction techniques, Discriminative approach and the Probabilistic approach for image pattern recognition.

Text Books

1. R. C.Gonzalez, R.E.Woods, " Digital Image processing", Pearson edition, Inc3/e, 2008.
2. A.K.Jain, " Fundamentals of Digital Image Processing", PHI,1995

Reference Books

1. J.C. Russ, " The Image Processing Handbook", (5/e), CRC, 2006
2. R.C.Gonzalez & R.E. Woods; "Digital Image Processing with MATLAB", Prentice Hall, 2003
3. E.S.Gopi, "Digital Image processing using Matlab", Scitech publications, 2005

COURSE OUTCOMES

Students are able to

- CO1: Reproduce the need for image transforms, different types of image transformation and their properties.
- CO2: Compare different techniques employed for the enhancement of images.
- CO3: Compare various spatial and frequency domain techniques of image processing.
- CO4: Summarize various morphological operations and segmentation techniques.
- CO5: Summarize various pattern recognition concepts and demonstrate the image pattern classifier.

| | | |
|--------------------------|----------|-----------------|
| Course Code | : | EC616 |
| Course Title | : | RF MEMS |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- To impart knowledge on basics of MEMS and their applications in RF circuit design.

COURSE CONTENT

Micromachining Processes - methods, RF MEMS relays and switches. Switch parameters. Actuation mechanisms. Bistable relays and micro actuators. Dynamics of switching operation.

MEMS inductors and capacitors. Micro-machined inductor. Effect of inductor layout. Modeling and design issues of planar inductor. Gap-tuning and area-tuning capacitors. Dielectric tunable capacitors.

MEMS phase shifters. Types. Limitations. Switched delay lines. Fundamentals of RF MEMS Filters.

Micro-machined transmission lines. Coplanar lines. Micro-machined directional coupler and mixer.

Micro-machined antennas. Microstrip antennas – design parameters. Micromachining to improve performance. Reconfigurable antennas.

Text Books

1. Vijay. K. Varadan, K.J. Vinoy, and K.A. Jose, “RF MEMS and their Applications”, Wiley-India, 2011.

Reference Books

1. H. J. D. Santos, “RF MEMS Circuit Design for Wireless Communications”, Artech House, 2002.
2. G. M. Rebeiz, “RF MEMS Theory, Design, and Technology”, Wiley, 2003.
3. Recent literature in RF MEMS.

COURSE OUTCOMES

Students are able to

CO1: learn the Micromachining Processes

CO2: learn the design and applications of RF MEMS inductors and capacitors.

CO3: learn about RF MEMS Filters and RF MEMS Phase Shifters.

CO4: learn about the suitability of micro-machined transmission lines for RF MEMS

CO5: learn about the Micro-machined Antennas and Reconfigurable Antennas

| | |
|--------------------------|-------------------------|
| Course Code | : EC617 |
| Course Title | : Smart Antennas |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To gain an understanding and experience with smart antenna environments, algorithms and implementation.

COURSE CONTENT

Spatial processing for wireless systems. Adaptive antennas. Beam forming networks. Digital radio receiver techniques and software radios.

Coherent and non-coherent CDMA spatial processors. Dynamic re-sectoring. Range and capacity extension – multi-cell systems.

Spatio – temporal channel models. Environment and signal parameters. Geometrically based single bounce elliptical model.

Optimal spatial filtering – adaptive algorithms for CDMA. Multitarget decision – directed algorithm.

DOA estimation – conventional and subspace methods. ML estimation techniques. Estimation of the number of sources using eigen decomposition. Direction finding and true ranging PL systems. Elliptic and hyperbolic PL systems. TDOA estimation techniques.

Text Books

1. *T.S.Rappaport & J.C.Liberti, Smart Antennas for Wireless Communication, Prentice Hall (PTR) , 1999.*
2. *R.Janaswamy, Radio Wave Propagation and Smart Antennas for Wireless Communication, Kluwer, 2001.*

Reference Book

1. *M.J. Bronzel, Smart Antennas, John Wiley, 2004.*
2. *Recent literature in Smart Antennas.*

COURSE OUTCOMES

Students are able to

- CO1: compare the performances of digital radio receivers and software radios.
- CO2: study the CDMA spatial processors to analyze the multi-cell systems.
- CO3: analyze the channel models for smart antenna systems.
- CO4: study the environmental parameters for signal processing of smart antenna systems.
- CO5: evaluate the requirements for the design and implementation of smart antenna systems.

| | |
|--------------------------|--------------------------|
| Course Code | : EC618 |
| Course Title | : Ad Hoc Networks |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To analyse the various design issues and challenges in the layered architecture of Ad hoc wireless networks

COURSE CONTENT

Cellular and ad hoc wireless networks, Applications of ad hoc wireless networks. Issues in ad hoc wireless networks-medium access scheme, routing, transport layer protocols, security and energy management. Ad hoc wireless internet.

Design goals of a MAC protocol, Contention based protocols; Contention based protocols with reservation mechanisms and scheduling mechanisms, MAC protocols using directional antennas.

Table driven routing protocols, On demand routing protocols, hybrid routing protocols, Hierarchical routing protocols, Power aware routing protocols, Tree based and mesh based multicast routing protocols

Network security requirements-Issues and challenges, network security attacks, key management, secure routing protocols

Energy management schemes-Battery management, transmission power management, system power management schemes. Quality of service solutions in ad hoc wireless networks.

Text books

1. C.Siva ram murthy,B.S. Manoj, "Ad hoc wireless networks-Architectures and protocols" Pearson Education, 2005
2. Stefano Basagni, Marco Conti, "Mobile ad hoc networking", Wileyinterscience 2004
3. Charles E.Perkins , "Ad hoc networking", Addison Wesley,2001

References books

1. Xiuzhen Cheng, Xiao Huang ,Ding Zhu DU , "Ad hoc wireless networking", Kluwer Academic Publishers,2004
2. George Aggelou, "Mobile ad hoc networks-From wireless LANs to 4G networks, McGraw Hill publishers, 2005
3. Recent literature in Ad Hoc Networks.

COURSE OUTCOMES

Students are able to

- CO1: compare the differences between cellular and ad hoc networks and the analyse the challenges at various layers and applications
- CO2: summarize the protocols used at the MAC layer and scheduling mechanisms
- CO3: compare and analyse types of routing protocols used for unicast and multicast routing
- CO4: examine the network security solution and routing mechanism
- CO5: evaluate the energy management schemes and Quality of service solution in ad hoc networks

| | |
|--------------------------|------------------------------------|
| Course Code | : EC619 |
| Course Title | : Wavelet Signal Processing |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To expose the students to the basics of wavelet theory and to illustrate the use of wavelet processing for data compression and noise suppression.

COURSE CONTENT

Limitations of standard Fourier analysis. Windowed Fourier transform. Continuous wavelet transform. Time-frequency resolution.

Multiresolution analysis and properties. The Haar wavelet, Structure of subspaces in MRA

Haar decomposition-1, Haar decomposition-2, Wavelet reconstruction, Haar wavelet and link to filter bank, demo on wavelet decomposition, Wavelet packets

Wavelet methods for signal processing. Noise suppression. Representation of noise-corrupted signals using frames. Algorithm for reconstruction from corrupted frame representation.

Wavelet methods for image processing. Burt- Adelson and Mallat's pyramidal decomposition schemes. 2D-dyadic wavelet transform.

Text Books

- E.Hernandez & G.Weiss, A First Course on Wavelets, CRC Press, 1996.*
- L.Prasad & S.S.Iyengar, Wavelet Analysis with Applications to Image Processing, CRC Press, 1997.*

Reference Books

- A.Teolis, Computational Signal Processing with Wavelets, Birkhauser, 1998*
- R.M. Rao & A.S. Bopardikar, Wavelet Transforms, Addison Wesley, 1998.*
- J.C. Goswami & A.K. Chan, Fundamentals of Wavelets, John Wiley, 1999.*
- Recent literature in Wavelet Signal Processing.*

COURSE OUTCOMES

Students are able to

CO1: understand about windowed Fourier transform and difference between windowed Fourier transform and wavelet transform.

CO2: understand wavelet basis and characterize continuous and discrete wavelet transforms

CO3: understand multi resolution analysis and identify various wavelets and evaluate their time-frequency resolution properties

CO4: implement discrete wavelet transforms in signal processing applications

CO5: understand about wavelet methods in image processing

| | |
|--------------------------|-------------------------------|
| Course Code | : EC620 |
| Course Title | : WDM Optical Networks |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVES

- To prepare the students understand the building blocks of optical network architecture.
- To enable the students appreciate the different routing networks in the WDM technology.
- To design optical network topology and routing to serve a defined application.

COURSE CONTENT

First generation optical networks. SONET/SDH. Computer interconnects. Metropolitan area networks. Layered architecture.

WDM optical network evolution. Enabling technologies. WDM optical network architecture. Wavelength routed networks.

Wavelength routing networks. Optical layer. Node designs. Network design and operations. Routing and wavelength assignment.

Wavelength convertible networks, performance evaluation. Networks with sparse wavelength conversion. Converter placement and allocation problems.

Virtual topology design problem, light path routes, implementation in broadcast and select networks.

Text Books

1. *R.Ramaswami & K.N.Sivarajan, Optical Networks, A Practical Perspective (3/e), Elsevier,2010*
2. *C.Sivaramamurthy & M.Gurusamy, WDM optical Networks, PHI, 2002.*
3. *S. B. Morris, "Network Management, MIBs and MPLS: Principles, Design and Implementation", 2003.*

Reference Books

1. *K.M.Sivalingam & S.Subramaniam, Optical WDM Networks- Principles & Practice, Kluwer Academic Publications, 2000.*
2. *T.E.Stern & K.Bala, Multiwavelength Optical Networks- A Layered Approach, (1/e), Printice Hall 1999.*
3. *Biswanath Mukherjee, Optical WDM Networks, Springer 2006.*
4. *Recent literature in WDM Optical Networks.*

COURSE OUTCOMES

Students are able to

- CO1: understand the structure of the first generation networks and SONET.
 CO2: understand the salient features of WDM network architecture of the optical amplifiers
 CO3: analyse various methods of optical nodal design and routing.
 CO4: compare the merits and demerits of various wavelength networks.
 CO5: design the virtual topology and routing for the select optical networks.

| | |
|--------------------------|---|
| Course Code | : EC621 |
| Course Title | : Advanced Techniques for Wireless Reception |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To get an understanding of signal processing techniques for emerging wireless systems.

COURSE CONTENT

Wireless signaling environment. Basic signal processing for wireless reception. Linear receivers for synchronous CDMA. Blind and group-blind multiuser detection methods. Performance issues.

Robust multiuser detection for non-Gaussian channels; asymptotic performance , implementation aspects.

Adaptive array processing in TDMA systems. Optimum space-time multiuser detection. Turbo multiuser detection for synchronous and turbo coded CDMA.

Narrowband interference suppression. Linear and nonlinear predictive techniques. Code- aided techniques. Performance comparison.

Signal Processing for wireless reception: Bayesian and sequential Montecarlo signal processing. Blind adaptive equalization of MIMO channels .Signal processing for fading channels. Coherent detection based on the EM algorithm. Decision-feedback differential detection. Signal processing for coded OFDM systems.

Text Books

1. X.Wang & H.V.Poor, "Wireless Communication Systems", Pearson, 2004.
2. R.Janaswamy, "Radio Wave Propagation and Smart Antennas for Wireless Communication", Kluwer, 2001.

Reference Books

1. M.Ibnkahla, "Signal Processing for Mobile Communications", CRC Press, 2005.
2. A.V.H. Sheikh, "Wireless Communications Theory & Techniques", Kluwer Academic Publications, 2004.
3. A.Paulraj ,Arogyaswami, R. Nabar, and D.Gore, "Introduction to Space-time Wireless Communications", Cambridge University Press, 2003.
4. Recent literature in Advanced Techniques for Wireless Reception.

COURSE OUTCOMES

Students are able to

- CO1: discuss the Wireless signaling environment and Performance issues.
- CO2: analyze the channel modeling and multiuser detection.
- CO3: analyze the Adaptive array processing and turbo coded CDMA.
- CO4: analyze Linear and nonlinear predictive techniques.
- CO5: analyze the Signal Processing Techniques for wireless reception.

| | |
|--------------------------|-------------------------------|
| Course Code | : EC622 |
| Course Title | : Error Control Coding |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To explain the importance of modern coding techniques in the design of digital communication systems.

COURSE CONTENT

Review of modern algebra. Galois fields. Linear block codes; encoding and decoding. Cyclic codes. Non-binary codes.

Convolutional codes. Generator sequences. Structural properties. ML decoding. Viterbi decoding. Sequential decoding.

Modulation codes. Trellis coded modulation. Lattice type Trellis codes. Geometrically uniform trellis codes. Decoding of modulation codes.

Turbo codes. Turbo decoder. Interleaver. Turbo decoder. MAP and log MAP decoders. Iterative turbo decoding. Optimum decoding of turbo codes.

Space-time codes. MIMO systems. Space-time codes. MIMO systems. Space-time block codes (STBC) – decoding of STBC.

Text Books

- S.Lin & D.J.Costello, "Error Control Coding (2/e)", Pearson, 2005.*
- B.Vucetic & J.Yuan, "Turbo codes", Kluwer, 2000*

Reference Books

- C.B.Schlegel & L.C.Perez, "Trellis and Turbo Coding", Wiley,2004.*
- B.Vucetic & J.yuan, "Space-Time Coding", Wiley, 2003.*
- R.Johannaesson & K.S.Zigangirov, "Fundamentals of Convolutional Coding", Universities Press, 2001.*
- Recent literature in Error Control Coding.*

COURSE OUTCOMES

Students are able to

- CO1: understand the need for error correcting codes in data communication and storage systems.
 CO2: identify the major classes of error detecting and error correcting codes and how they are used in practice. Construct codes capable of correcting a specified number of errors.
 CO3: use the mathematical tools for designing error correcting codes, including finite fields.
 CO4: explain the operating principles of block codes, cyclic codes, convolution codes, modulation codes, Turbo codes etc.
 CO5: design an error correcting code for a given application.

| | | |
|--------------------------|----------|--|
| Course Code | : | EC623 |
| Course Title | : | Digital Communication Receivers |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- To expose the students to the latest trends in the design of digital communication receivers with particular emphasis on synchronization, channel estimation and signal processing aspects.

COURSE CONTENT

Baseband PAM. Clock recovery circuits. Error tracking and spectral – line generating synchronizers. Squaring and Mueller and Muller synchronizers.

Channel models. Receivers for PAM. Optimum ML receivers. Synchronized detection. Digital matched filter.

ML synchronization algorithms – DD and NDA. Timing parameter and carrier phase estimation – DD and NDA.

Performance analysis of carrier and symbol synchronizers. Feedback and feed forward synchronizers. Cycle slipping Acquisition of carrier phase and symbol timing.

Fading channels. Statistical characterization. Flat and frequency selective fading channels. Optimal receivers for data detection and synchronization parameter estimation. Realizable receiver structures for synchronized detection.

Text Books

- H.Meyer , M. Moeneclaey, and S. A. Fechtel, “Digital Communication Receivers”, Wiley, 1998.*
- U.Mengali & A.N.D.Andrea, “Synchronization Techniques for Digital Receivers”, Kluwer , 1997.*

Reference Books

- N.Benuveruto & G.Cherubini, “Algorithms for Communication Systems and their Applications”, Wiley, 2002.*
- H.Meyer & G.Ascheid, “Synchronization in Digital Communications”, John Wiley, 1990.*
- Recent literature in Digital Communication Receivers.*

COURSE OUTCOMES

Students are able to

- CO1: summarize baseband PAM and Synchronizers.
- CO2: model and distinguish the channels.
- CO3: interpret optimum receivers and matched filter receivers.
- CO4: summarize phase and carrier estimation methods.
- CO5: compare carrier and symbol synchronizers.

| | |
|--------------------------|---|
| Course Code | : EC624 |
| Course Title | : Analysis Methods for Passive MIC |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To make the students confident in designing M, I, C, components in any planar transmission line and also to familiarize multi-layer structure.

COURSE CONTENT

Parameters of planar transmission line variants. Static and dynamic analysis methods for microstripline, coplanar waveguide, coplanar strips, striplines and slot line.

Spectral domain methods. Formulation of quasi static and dynamic spectral domain analyses. Galekin's method.

Hybrid mode analysis. Formulation. Application in planar transmission lines. Characteristic equation. Evaluation of parameters.

Coplanar lines , quasi-static and full wave analysis. Design equations. Comparison with microstrip and slot lines.

General analysis of coupled lines. Design considerations for microstrip lines and coplanar waveguides.

Text Books

1. T.Itoh, "Numerical Techniques for Microwave and Millimeter Wave Passive Structures", John Wiley & Sons, 1989.
2. C.Nguyen, "Analysis Methods for RF, Microwave and Planar Transmission Line Structures", Wiley, 2000

Reference Book

1. C. Nguyen, "Analysis Methods for RF, Microwave, and Millimeter-Wave Planar Transmission Line Structures", Wiley Inter science, 2000.
2. Bharathi Bhat and Shiben K Koul, "Stripline like transmission lines for Microwave Integrated Circuits" John Wiley & Sons Inc (March 1, 1990)
3. Recent literature in Passive MIC.

COURSE OUTCOMES

Students are able to

- CO1: analyze any planar transmission lines, usage of different planar transmissions lines for various frequencies and for various antennas.
- CO2: appreciate the features of different spectral domain methods.
- CO3: understand the hybrid mode analysis and its application in planar transmission lines
- CO4: understand the analysis and design equations of coplanar lines and
- CO5: appreciate the design considerations of microstrip and coplanar waveguides.

| | |
|--------------------------|--|
| Course Code | : EC625 |
| Course Title | : Electromagnetic Metamaterials |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To understand the properties of metamaterials and MTM inspired structures for antenna performance improvement, microwave components.

COURSE CONTENT

Introduction - Definition of Metamaterials (MTMs) and Left-Handed (LH) MTMs, Theoretical Speculation by Viktor Veselago, Experimental Demonstration of Left-Handedness, Conventional Backward Waves and Novelty of LH MTMs, Terminology, Transmission Line (TL) Approach, Composite Right/Left- Handed (CRLH) MTMs, Left-Handedness from Maxwell's Equations, Boundary Conditions, Reversal of Doppler Effect, Reversal of Snell's Law: Negative Refraction.

TL Theory of MTMs, Ideal Homogeneous CRLH TLs: Fundamental TL Characteristics, Equivalent MTM Constitutive Parameters, Balanced and Unbalanced Resonances, Lossy Case, LC Network Implementation, Difference with Conventional Filters, Transmission Matrix Analysis, Input Impedance, General Design Guidelines, Microstrip Implementation, Parameters Extraction, Conversion from Transmission Line to Constitutive Parameters.

An overview of different types of SRR and CSRR, Equivalent circuit model for MSRR, Labyrinth and spiral resonator, Parameters extraction using NRW approach.

LH-TL loaded antenna, Electrically small antenna, Thin wavelength resonator design, Partial metamaterial loading, Sub-wavelength antenna, Metamaterial substrate, Metamaterial superstrate, CSRR loaded antenna, OCSR loaded monopole antenna, Bandwidth enhancement, Notch function using SRR in UWB antenna, MTM inspired antenna.

Guided-Wave Applications - Dual-Band Components: Dual-Band Property of CRLH TLs - Quarter-Wavelength TL and Stubs - Passive Component Examples: Quadrature Hybrid and Wilkinson Power Divider - Enhanced-Bandwidth Components: Principle of Bandwidth Enhancement - Rat-Race Coupler Example.

Text Book

1. *Christophe Caloz, Tatsuo Itoh, "Electromagnetic Metamaterials: Transmission Line Theory and Microwave Applications" by John Wiley & Sons, Inc., Hoboken, New Jersey, 2006.*
2. *Ricardo Marqués, Ferran Martín, Mario Sorolla, Metamaterials with Negative Parameters: Theory, Design, and Microwave Applications, Wiley, Inc., 2008*
3. *Filippo Capolin, Theory and Phenomena of Metamaterials, CRC Press, 2009*

COURSE OUTCOMES

Students are able to

- CO1: learn and understand the properties of metamaterials and the effect of properties on fundamental phenomena
- CO2: understand the theory of Transmission line theory of Metamaterials.
- CO3: discuss different types of SRR and to derive equivalent circuit
- CO4: discuss the metamaterial properties for performance enhancement of antenna.
- CO5: learn the design of microwave components using metamaterials.

| | |
|--------------------------|-------------------|
| Course Code | : EC626 |
| Course Title | : Bio MEMS |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To train the students in the design aspects of Bio MEMS devices and Systems. To make the students aware of applications in various medical specialists especially the Comparison of conventions methods and Bio MEMS usage.

COURSE CONTENT

Introduction-The driving force behind Biomedical Applications – Biocompatibility - Reliability Considerations-Regularity Considerations – Organizations - Education of Bio MEMS-Silicon Micro fabrication-Soft Fabrication techniques

Micro fluidic Principles- Introduction-Transport Processes- Electro kinetic Phenomena-Micro valves –Micro mixers- Micro pumps.

SENSOR PRINCIPLES and MICRO SENSORS: Introduction-Fabrication-Basic Sensors-Optical fibers-Piezo electricity and SAW devices-Electrochemical detection-Applications in Medicine

MICRO ACTUATORS and DRUG DELIVERY: Introduction-Activation Methods-Micro actuators for Micro fluidics-equivalent circuit representation-Drug Delivery

MICRO TOTAL ANALYSIS: Lab on Chip-Capillary Electrophoresis Arrays-cell, molecule and Particle Handling-Surface Modification-Microsphere-Cell based Bioassay Systems
Detection and Measurement Methods-Emerging Bio MEMS Technology-Packaging, Power, Data and RF Safety-Biocompatibility, Standards

Text Book

1. *Steven S. Saliterman, Fundamentals of Bio MEMS and Medical Micro devices, Wiley Interscience, 2006.*

Reference Books

1. *Albert Folch , Introduction to Bio MEMS, CRC Press, 2012*
2. *Gerald A. Urban, Bio MEMS, Springer, 2006*
3. *Wanjun wang, steven A. Soper, Bio MEMS, 2006.*
4. *M. J. Madou, “Fundamental of Micro fabrication”, 2002.*
5. *G.T. A. Kovacs, “Micro machined Transducers Sourcebook”, 1998.*
6. *Recent literature in Bio MEMS.*

COURSE OUTCOMES

Students are able to

- CO1: learn and realize the MEMS applications in Bio Medical Engineering
- CO2: understand the Micro fluidic Principles and study its applications.
- CO3: learn the applications of Sensors in Health Engineering.
- CO4: learn the principles of Micro Actuators and Drug Delivery system
- CO5: learn the principles and applications of Micro Total Analysis

| | |
|--------------------------|---|
| Course Code | : EC627 |
| Course Title | : Substrate Integrated Waveguide Technology: Design and Analysis |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- To make the students familiar with Substrate Integrated Waveguide (SIW) Technology with emphasis on Circuits Analysis, Design and Layout of SIW components.

COURSE CONTENT

Introduction: Substrate Integrated Waveguide Technology, SIW Circuits Composed of Metallic Posts, SIW Circuits with Dielectric Posts.

A typical SIW circuit and its equivalent problem, Field expressions, Boundary conditions, Z-matrix, S-matrix Sub-ports combination Modeling of losses.

Even-Odd Mode Analysis of a Symmetrical Circuit, Half circuit with PMC symmetry wall, half circuit with PEC symmetry wall, Microstrip or planar transmission line to SIW Transition and Half Mode SIW.

Substrate Integrated Circuits (SICs) and components, Filters, couplers Mixers, Amplifiers and SIW antennas.

Numerical Technique for SIW analysis: Methods of line.

Reference Books

1. *Xuan Hui Wu, Ahmed Kishk, Analysis and Design of Substrate Integrated Waveguide Using Efficient 2D Hybrid Method.*
2. *P. Arcioni, Roselli, Rogier, A. Georgiadis Microwave and Millimeter Wave Circuits and Systems: Emerging Design, Technologies and Applications, 2nd Edition, Published by John Wiley & Sons.*
3. *Recent literature in Substrate Integrated Waveguide Technology.*

COURSE OUTCOMES

Students are able to

CO1: Gain knowledge & will be employable in all the corporate and R&D sections deals with Microwave Integrated Circuits.

| | | |
|--------------------------|----------|---|
| Course Code | : | EC628 |
| Course Title | : | Pattern Recognition and Computational Intelligence |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- The subject aims to make the students to understand the mathematical approach for pattern recognition. and computational intelligence

COURSE CONTENT

Polynomial curve fitting – The curse of dimensionality - Decision theory - Information theory - The beta distribution - Dirichlet distribution-Gaussian distribution-The exponent family: Maximum likelihood and sufficient statistics -Non-parametric method: kernel-density estimators - Nearest neighbour methods.

Linear models for regression and classification: Linear basis function models for regression - Bias variance decomposition-Bayesian linear regression-Discriminant functions - Fisher's linear discriminant analysis (LDA) - Principal Component Analysis (PCA) - Probabilistic generative model - Probabilistic discriminative model- Independent Component Analysis (ICA)

Kernel methods: Dual representations-Constructing kernels-Radial basis function networks-Gaussian process-Maximum margin classifier (Support Vector Machine) –Relevance Vector Machines-Kernel-PCA, Kernel-LDA.

Mixture models: K-means clustering - Mixtures of Gaussian - Expectation-Maximization algorithm- Sequential models: Markov model, Hidden-Markov Model (HMM) - Linear Dynamical Systems (LDS).

Neural networks: Feed- forward Network functions-Network training - Error Back propagation - The Hessian Matrix - Regularization in Neural Network - Mixture density networks – Bayesian Neural Networks - Particle swarm optimization-Genetic algorithm-Ant colony optimization-Bacterial foraging-Simulated annealing – Fuzzy logic systems

Text Books

1. *C.M.Bishop, "Pattern recognition and machine learning", Springer, 2006*
2. *E.S.Gopi, "Pattern recognition and Computational intelligence using matlab, Transactions on computational science and computational intelligence, Springer, 2019*

Reference Books

1. *Sergious Theodoridis ,Konstantinos Koutroumbas, Pattern recognition, Elsevier, Fourth edition, 2009*
2. *Richard O.Duda, Peter.E.Hart, David G.Stork, "Pattern classification", Wiley, Second edition, 2016*
3. *E.S.Gopi, 'Algorithm collections for Digital signal Processing application using Matlab-Springer , 2007*
4. *Recent literature in the related topics*

COURSE OUTCOMES

Students are able to

- CO1: summarize the various techniques involved in pattern recognition
- CO2: identify the suitable pattern recognition techniques for the particular applications.
- CO3: categorize the various pattern recognition techniques into supervised and unsupervised.
- CO4: summarize the mixture models based pattern recognition techniques
- CO5: summarize the various computational intelligence techniques for pattern recognition

| | | |
|--------------------------|----------|-------------------------------------|
| Course Code | : | EC629 |
| Course Title | : | Photonic Integrated Circuits |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- The photonic integrated circuits course will introduce the basics of various integrated optical waveguides and devices used in optical communication applications.
- This course also covers materials and fabrication technology for optical integrated circuits.

COURSE CONTENT

Brief history of optical communication, Advantages of integrated optics configuration, Guided TE and TM Modes of Symmetric and anti-symmetric planar waveguides: Step-index and graded-index waveguides. Strip and channel waveguides, anisotropic waveguides. Marcatili's Method, Effective-Index method and perturbation method of analysis, Beam propagation method.

Directional couplers, Coupled mode analysis of uniform and reverse delta-beta couplers. Applications as power splitters, Y-junction, optical switch; Phase and amplitude modulators, filters, A/D converters, Y-splitters, Mode splitters, polarization splitters; Mach-Zehnder interferometer based devices.

Acousto-optic waveguide devices. Arrayed waveguide devices, Nano-photonic-devices: Metal/dielectric plasmonic waveguides, long and short range surface Plasmon modes supported by thin metal films, applications in waveguide polarizers.

Materials. Glass, lithium niobate, silicon, compound semiconductors, polymers. Fabrication of integrated optical waveguides and devices. Lithography, ion-exchange, deposition, diffusion process. Waveguide characterisation, end-fire and prism coupling, grating and tapered couplers, Fiber pigtailling.

Nonlinear effects in integrated optical waveguides, Self-phase modulation, Cross-phase modulation, Four-wave mixing, Stimulated Brillouin Scattering, Stimulated Raman Scattering.

COURSE OUTCOMES

Students are able to

- CO1: Summarize the fundamental concept of optical waveguides.
- CO2: Construct the different types of optical waveguides.
- CO3: Construct the couplers, modulators and devices for communication applications
- CO4: Summarize fabrication technologies for design of optical waveguides
- CO5: Describe the various nonlinear effects in integrated optical waveguides.

| | | |
|--------------------------|----------|----------------------------|
| Course Code | : | EC630 |
| Course Title | : | Fiber-Optic Sensors |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- The objective of this course is to understand the basic concepts and working principles of various optical fibers based photonic sensors.
- This course will be useful to design and develop sensors for sensing various physical parameters in practical applications.

COURSE CONTENT

Review of propagation characteristics of single, multimode optical fibers and Photonic crystal fibers. Surface Plasmon modes supported by metal-dielectric interface.

Optical modulators for fiber optic sensors. Intensity, phase, polarization and wavelength modulation schemes. Intensity based sensors using microbends and tapers in multi-mode fibers. Position sensors, Polarization sensors.

Fiber optic SAGNAC interferometer sensors, SAGNAC effect, Fiber Optic gyros, Mach-Zehnder interferometer sensors. Fiber optic magnetic, current sensors.

Fiber grating sensors. Single parameter, Multiparameter grating sensors. Sensors based on modal interference. Fiber optic biosensors. Industrial applications.

Distributed optical fiber sensors, Optical scattering in fiber, Sensors based on Rayleigh, Raman and Brillouin scattering. Fiber sensors based on Surface Plasmon Resonance (SPR) and Surface Plasmon wave (SPW). Photonic crystal fiber sensors. Noise effects in sensors.

5. *Shizhuo Yin, Paul B Ruffin, Francis T. S. Yu, Fiber Optic Sensors, 2nd Ed. CRC Press, 2008*
6. *Recent journals publications and conference proceedings.*

COURSE OUTCOMES

Students are able to

- CO1: Summarize the basic propagation principle in optical fibers.
- CO2: Construct the different types of modulators for optical fiber sensors.
- CO3: Construct the grating sensors and distributed sensors in fibers.
- CO4: Describe the theoretical principle of fiber sensors based on surface Plasmon effect.
- CO5: Describe the design of application specific fiber optic sensors.

| | |
|--------------------------|--|
| Course Code | : EC631 |
| Course Title | : Optical Wireless Communications |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- This subject provides the in-depth knowledge in Optical Wireless Communication systems. It covers the emerging Optical wireless communication trends and their applications.

COURSE CONTENT

Introduction to Optical Wireless Communication: Optical communication systems- wireless access- Need of Optical Wireless Communication (OWC)-block diagram-challenges- Application -Optical sources-optical detectors-Optical Detection Statistics

Optical wireless communication theory - channel modeling - Indoor optical wireless communication channel-LOS propagation model-Spherical and Guassian wave model-outdoor channel- Attenuation-Beam Wander-Turbulence (Scintillation/Fading)-Turbidity (rain, fog, snow)-Cloud-free line of sight-log normal negative exponential- gamma-gamma turbulence model-modulation schemes for optical wireless-Analogue intensity modulation-Digital base band-pulse modulation-subcarrier intensity modulation –optical polarization shift keying- BER performance analysis

Free space optical communications: Introduction-operating principles-characteristics-Qos and availability--FSO OFDM communication-FSO underwater- Free space optical networks-laser satellite communication.

Coded modulation techniques for OWC- Coded MIMO for OWC- Indoor OWC MIMO channel-Point to point OW MIMO communications- MIMO FSO-Wireless optical CDMA Communication system-System description-indoor wireless optical CDMA-FSO CDMA

Visible light communications- VLC principle- VLC system model- system implementation-VLC applications

Infrared optical wireless communications - Optical wireless in sensor networks- FSO Sensor networks.

6. Roberto Ramirez-Iniguez, Sevia M.Idrus, Ziran sun “Optical wireless communications: IR for wireless connectivity” CRC Press, Taylor and Francis Group, 2007.
7. Recent literature in Optical Wireless Communication.

COURSE OUTCOMES

Students are able to

CO1: interpret the principles of Optical wireless communication devices and systems.

CO2: model the channel for indoor and outdoor OWC systems and analyze the impact of modulation techniques on bandwidth and power efficiency.

CO3: summarizes the free space optical communication and Laser satellite communication.

CO4: summarizes the coded modulation techniques for OWC, coded MIMO and CDMA techniques in FSO.

CO5: summarizes the principle of Visible Light, Infrared Communications and utilization of OWC in sensor networks.

| | |
|--------------------------|---|
| Course Code | : EC632 |
| Course Title | : Foundations of Artificial Intelligence |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- Approaches to produce "intelligent" systems, Knowledge representation (both symbolic and neural network), search and machine learning.
- To learn the principles and fundamentals of designing AI programs.

COURSE CONTENT

Introduction to artificial Intelligence, problem solving as state space search, Uninformed search, heuristic search, informed search, constrained satisfaction problem

Knowledge representation and Reasoning-Introduction to knowledge representation, propositional logic, first order logic, inference in first order logic, answer extraction, procedural control of reasoning, reasoning under uncertainty, Bayesian network, decision network.

Planning and decision making- Introduction to planning, plan space planning, planning graph and graph plan, practical planning and acting, sequential decision problems, making complex decisions.

Machine learning- Introduction to ML, learning decision trees, linear regression, SVM, supervised learning, unsupervised learning, reinforcement learning,

Introduction to deep learning and neural network learning

Text Books

1. *Patrick Henry Winston, Artificial Intelligence, Third Edition, Addison-Wesley Publishing Company, 2004.*
2. *Stuart Russell and Peter Norvig, Artificial Intelligence: A Modern Approach, 3rd Edition, PHI 2009.*

Reference Books

1. *Nils J Nilsson, Principles of Artificial Intelligence, Illustrated Reprint Edition, Springer Heidelberg, 2014.*
2. *Nils J. Nilsson, Quest for Artificial Intelligence, First Edition, Cambridge University Press, 2010.*

COURSE OUTCOMES

Students are able

CO1: To learn the concepts of artificial intelligence

CO2: To study problem solving techniques

CO3: To understand the representation of knowledge and reasoning mechanism

CO4: To learn to planning and decision making

CO5: To study network models used for learning

| | |
|--------------------------|--|
| Course Code | : EC633 |
| Course Title | : Introduction to Soft Computing and Machine Learning |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- Focus on fundamental concepts and techniques for approaching artificial intelligence.

COURSE CONTENT

Learning and generalisation-structure of neural networks Neuron, Nerve structure and synapse, Artificial Neuron and its model, activation functions, McCulloch Pitts - neuron model – simple perceptron – Adaline and Madaline, Neural network architecture: Linear separability, single layer and multilayer feed forward networks, recurrent networks.

Various learning techniques; Supervised Learning Neural Networks –Reinforcement Learning – Unsupervised Learning Neural Networks, Auto-associative and hetero-associative memory, Content addressable memory, Back propagation algorithm, factors affecting back propagation training, gradient descent, the Steepest Descent algorithm, The Back-propagation algorithm applications. Stability-plasticity dilemma, Adaptive Resonance Architectures I , II – Advances in Neural Networks, – Examples. BIONET - Case study of connectionist expert systems for medical diagnosis.

Basic concepts of fuzzy logic, Fuzzy sets and Crisp sets, Fuzzy set theory and operations, Properties of fuzzy sets, Fuzzy and Crisp relations, Fuzzy to Crisp conversion Fuzzy Inference Systems – Fuzzy Expert Systems – Fuzzy Decision Making, Adaptive Neuro-Fuzzy Inference Systems – Coactive Neuro-Fuzzy Modeling – Classification and Regression Trees – Data Clustering Algorithms.

Fuzzy logic control – Case studies: Inverted pendulum – Home heating system – Mountain car problem. Introduction, Building block hypothesis, working principle, Basic operators and Terminologies like individual, gene, encoding, fitness function and reproduction, Genetic modeling: Significance of Genetic operators, Inheritance operator, cross over, inversion & deletion, mutation operator, Bitwise operator, GA optimization problems, JSP (Job Shop Scheduling Problem), TSP (Travelling Salesman Problem), Differences & similarities between GA & other traditional methods, Applications of GA.

From Conventional AI to Computational Intelligence - Machine Learning Basics, Passive reinforcement learning – direct utility estimation – adaptive dynamic programming – temporal-difference learning – active reinforcement learning – exploration – learning an action-utility function – Generalization in reinforcement learning – policy search – applications in game playing – applications in robot control.

6. M. Mohri, A. Rostamizadeh, and A. Talwalkar, "Foundations of Machine Learning", MIT Press, 2012.
7. T. M. Mitchell, "Machine Learning", McGraw Hill, 1997.

COURSE OUTCOMES

Students are able to

- CO1: To explain theory underlying Soft computing
- CO2: To construct algorithms to learn neural network models
- CO3: To implement fuzzy logic algorithms
- CO4: To construct algorithms to learn Genetic Algorithm models
- CO5: To apply reinforcement learning techniques

| | | |
|--------------------------|---|-----------------------------|
| Course Code | : | EC634 |
| Course Title | : | Next Generation WLAN |
| Number of Credits | | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- To expose students to wireless local area network standards, technologies, and operations with real-life traces to correlate with the concepts

COURSE CONTENT

WLAN Introduction and Basics - 802.11 protocol stack basics, RF spectrum of operations, unlicensed band usage, Types of networks and their usage, Role of Wi-Fi alliance. Exercises: Survey of WLAN products in consumer appliances like laptops, phones, tablets, and other devices, their type; Visit WFA webpage to get a list of WLAN certified products and the various certification programs listed.

WLAN Physical Layer - Indoor multipath channel conditions and models, Delay spread and ISI impacts on high data rate transmission, Evolution of the WLAN PHY. Layer, OFDM design and parameters for WLAN, MIMO usage in WLAN, **Exercises:** Matlab Simulation of channel models and studying their characteristics, 802.11 waveform generation using Matlab and checking spectrum and evm effects due to frequency offset

WLAN MAC Layer - CSMA/CA principles used for WLAN MAC, Details of MAC protocol, Medium reservation and hidden nodes, MAC Frame Aggregation and QoS in WLAN, Roaming. **Exercises:** Calculate duration of a frame transmission based on size, rate, and the MAC protocol IFS'. Calculate NAV values in RTS/CTS frames MAC throughput calculation with and without aggregation.

WLAN Network Operations - Network Entry Process in WLAN, Security Evolution, Power save concepts, Throughput and performance of WLAN. **Exercises:** Traces with experimental setup explained can be given to students with opensource tool like wireshark. All the network operations can be converted to suitable exercises in the hands on analysis section.

WLAN Protocol Analysis - Sniffing WLAN Frames and analysis using open source tools, Inferring capabilities of APs and clients, Analysing network entry steps and debugging connection problems, Analysing Data transmission and debugging performance issues, Analysis of Roaming performance.

Text Books

- Eldad Perahia and Robert Stacey, Next Generation wireless LANS 802.11n and 802.11ac, 2nd edition, Cambridge University Press, 2013*
- Mathew Gast, 802.11 Wireless Networks: The Definitive Guide, 2nd Edition, OReily, 2009*

Reference Books

- Mathew Gast, 802.11n: A Survival Guide: Wi-Fi Above 100 Mbps, OReilly, 2012*
- Mathew Gast, 802.11ac: A Survival Guide: Wi-Fi at Gigabit and Beyond, OReilly, 2012*

Course Outcomes:

Students are able to

CO1: To understand basics of WLAN systems including standardizing bodies, unlicensed spectrum ranges, network types.

CO2: Appreciate physical layer challenges and solutions in 802.11 standards and be able to simulate channel conditions

CO3: Be able to explain MAC layer steps in WLAN along with the motivation and impacts on throughput and coexistence

CO4: Trace the steps followed in a typical WLAN network with a clear understanding of security, power save, and network entry procedures

CO5: Analyze real-life protocol traces under various conditions and correlate with the concepts learnt in the earlier sections.

| | | |
|--------------------------|----------|---|
| Course Code | : | EC635 |
| Course Title | : | Electromagnetic Interference and Compatibility |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- Electromagnetic interference (EMI) is a potential threat to the present day electronic systems. The main objective of the course is to provide insight into various sources of electromagnetic interferences and how to design an electronic product which is electromagnetically compatible with each other.

COURSE CONTENT

Introduction to EMI and EMC- Various EMC requirements and standards-Need for EMC and its importance in electronic product design - sources of EMI - few case studies on EMC.

Conducted and radiated emission -power supply line filters-common mode and differential mode current-common mode choke- switched mode power supplies. Shielding techniques- shielding effectiveness-shield behavior for electric and magnetic field -aperture-seams-conductive gaskets- conductive coatings

Grounding techniques- signal ground-single point and multi point grounding-system ground-common impedance coupling -common mode choke-Digital circuit power distribution and grounding.

Contact protection - arc and glow discharge-contact protection network for inductive loads-C, RC, RCD protection circuit- inductive kick back. RF and transient immunity-transient protection network- RFI mitigation filter-power line disturbance- ESD- human body model- ESD protection in system design.

PCB design for EMC compliance-PCB layout and stack up- multi layer PCB objectives- Return path discontinuities-mixed signal PCB layout. EMC pre compliance measurement-conducted and radiated emission test-LISN-Anechoic chamber.

Text Books:

1. H. W. Ott, *Electromagnetic Compatibility Engineering*, 2nd edition, John Wiley & Sons, 2011, ISBN: 9781118210659.
2. C. R. Paul, *Introduction to Electromagnetic Compatibility*, 2nd edition, Wiley India, 2010, ISBN: 9788126528752

Reference Book:

1. K. L. Kaiser, *Electromagnetic Compatibility Handbook*, 1st edition, CRC Press, 2005. ISBN: 9780849320873

COURSE OUTCOMES

Students are able to

- CO1: Understand the various sources of Electromagnetic interference
- CO2: Familiarize the fundamentals those are essential for product design with EMC compliance and various EMC standards
- CO3: would gain knowledge to understand the concept of Shielding and grounding related to product design.
- CO4: Design PCBs which are electromagnetically compatible
- CO5: understand and differentiate the various EMC pre compliance measurement

| | | |
|--------------------------|----------|------------------------|
| Course Code | : | EC636 |
| Course Title | : | Computer Vision |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- The focus of this course is the understanding of algorithms and techniques used in computer vision.
- Provide pointers into the literature and exercise a project based on a literature search and one or more research papers.
- Practice software implementation of different concepts and techniques covered in the course.
- Utilize programming and scientific tools for relevant software implementation.

COURSE CONTENT

Introduction: overview of computer vision, related areas, and applications; overview of software tools; overview of course objectives.; introduction to OpenCV. Image formation and representation: imaging geometry, radiometry, digitization, cameras and projections, rigid and affine transformations, Filtering: convolution, smoothing, differencing, and scale space

Feature detection: edge detection, corner detection, line and curve detection, active contours, SIFT and HOG descriptors, shape context descriptors, Model fitting: Hough transform, line fitting, ellipse and conic sections fitting, algebraic and Euclidean distance measures.

Camera calibration: camera models; intrinsic and extrinsic parameters; radial lens distortion; direct parameter calibration; camera parameters from projection matrices; orthographic, weak perspective, affine, and perspective camera models.

Motion analysis: the motion field of rigid objects; motion parallax; optical flow, the image brightness constancy equation, affine flow; differential techniques; feature-based techniques; regularization and robust estimation; motion segmentation through EM, Motion tracking: statistical filtering; iterated estimation; observability and linear systems; the Kalman filter; the extended Kalman filter

Object recognition and shape representation: alignment, appearance-based methods, invariants, image Eigen spaces, data-based techniques.

Text Books

1. *Computer Vision: Algorithms and Applications*, R. Szeliski, Springer, 2011.
2. *Computer Vision: A Modern Approach*, D. Forsyth and J. Ponce, Prentice Hall, 2nd ed., 2011.
3. *Introductory techniques for 3D computer vision*, E. Trucco and A. Verri, Prentice Hall, 1998.

COURSE OUTCOMES

Students are able

CO1: To understand the fundamental problems of computer vision.

CO2: To learn techniques, mathematical concepts and algorithms used in computer vision to facilitate further study in this area.

CO3: To get an idea regarding the camera calibration and its importance.

CO4: To study different kinds of motion estimation methodologies and its applications.

CO5: To understand the basic concepts of object and shape recognition techniques

| | | |
|--------------------------|----------|------------------------------------|
| Course Code | : | EC637 |
| Course Title | : | Natural Language Processing |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE LEARNING OBJECTIVE

- Understand NLP tasks in syntax, semantics and pragmatics
- Implement machine learning techniques used in NLP

Introduction – Why NLP? NLP versus speech recognition- Applications-problem of ambiguity- role of machine learning in NLP- Basic neural networks for NLP

Words – Morphology and Finite State transducers-Tokenization – Computational Phonology and Pronunciation Modelling

Probabilistic models in NLP — Role of language models- Simple N-gram model – Evaluation: Perplexity and Word Error Rate. Parts of Speech Tagging- Hidden markov models–Viterbi algorithm, Maximum Entropy Markov model

Semantic analysis - Lexical semantics and word-sense disambiguation. Compositional semantics. Semantic Role Labeling and Semantic Parsing

Machine Translation - Statistical translation, word alignment, phrase-based translation, and synchronous grammars, evaluation.

Reference Books

1. *Natural Language Processing*, by Jacob Eisenstein, MIT Press.
2. *Speech and Language Processing* by Daniel Jurafsky and James H. Martin
3. *Foundations of Statistical Natural Language processing* by Manning C. D. and Schutze H., First Edition, MIT Press, 1999
4. *Neural Network Methods for Natural Language Processing* by Yoav Goldberg, Morgan & Claypool Publishers.

COURSE OUTCOMES

Students are able to

CO1: Understand NLP and the role of machine learning in NLP

CO2: Describe finite state transducer operations and pronunciation modelling in NLP

CO3: Illustrate various probabilistic models in NLP.

CO4: Study semantic analysis in NLP

CO5: Learn various machine translation approaches and the different evaluation metrics.

| | | |
|--------------------------|----------|---|
| Course Code | : | EC638 |
| Course Title | : | Optimization Methods In Machine Learning |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE LEARNING OBJECTIVE

- The course aims to equip students with advanced techniques and methods in optimization that are tailored to large-scale statistics and machine learning problems

COURSE CONTENT

Basics of convex optimization- convex sets, convexity-preserving operations, examples of convex programs (linear programming (LP), second-order cone programming (SOCP), semidefinite programming (SDP)), convex relaxation, KKT conditions, duality

Gradient-based methods- gradient descent, subgradient, mirror descent, Frank–Wolfe method, Nesterov’s accelerated gradient method, ODE interpretations, dual methods, Nesterov’s smoothing, proximal gradient methods, Moreau–Yosida regularization

Operator splitting methods- augmented Lagrangian methods, alternating direction method of multipliers (ADMM), monotone operators, Douglas–Rachford splitting, primal and dual decomposition

Stochastic and nonconvex optimization-dual averaging, Polyak–Juditsky averaging, stochastic variance reduced gradient (SVRG), Langevin dynamics, escaping saddle points, landscape of nonconvex problems, deep learning

Applications of optimization methods in Image/Video/Multimedia Processing

Textbooks:

1. *Stephen Boyd and Lieven Vandenberghe’s book: Convex Optimization*
2. *Nesterov’s old book: Introductory Lectures on Convex Optimization: A Basic Course*
3. *Nesterov’s new book: Lectures on Convex Optimization*
4. *Neal Parikh and Stephen Boyd’s monograph: Proximal Algorithms*
5. *Sebastien Bubeck’s monograph: Convex Optimization: Algorithms and Complexity*

References

1. *Moritz Hardt’s Berkeley EE 227C course note*
2. *Prateek Jain and Purushottam Kar’s survey on nonconvex optimization*
3. *Kristin Bennett, Emilio Parrado-Hernandez. Interplay of Optimization and Machine Learning Research, Journal of Machine Learning Research, 2006.*
4. *Nati Srebro, Ambuj Tewari. Stochastic Optimization for Machine Learning, Tutorial at International Conference on Machine Learning, 2010.*

COURSE OUTCOMES

Students are able

CO1: To learn the basic concepts of convex optimization

CO2: To study gradient based optimization techniques

CO3: To understand the problem solving using operator splitting methods

CO4: To learn stochastic and non-convex optimization Techniques,

CO5: To execute applications of optimization techniques in different domains

| | | |
|--------------------------|----------|-----------------------------------|
| Course Code | : | EC639 |
| Course Title | : | Hardware for Deep Learning |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE LEARNING OBJECTIVE

To get an idea about deep learning and how to implement deep learning algorithms on FPGA

COURSE CONTENT

Introduction to Deep Learning: From AI to DL, Neural Network: Perceptrons, Back Propagation, Overfitting, Regularization. Deep Networks: Definition, Motivation, Applications, Convolution Neural Network (CNN): Basic architecture, Activation functions, Pooling, Handling vanishing gradient problem, Dropout, Weight initialization methods, Batch Normalization. Training Neural networks, Additional CNN Components, Famous CNNs, Applications, Software libraries.

Computing Convolutions: Mapping Matrix multiplication, Computational Transforms, Accelerator Architectures, Dataflow Taxonomy

Reducing the Complexity: Light weight models, reducing precision, Aggressive Quantization, pruning & Deep compression.

The Deep Learning Acceleration Landscape: parallelism in deep learning, Traditional programmable hardware, specialized deep learning hardware platforms, deep learning software stack, Specialized research ASICs.

FPGAs for Deep Learning: Overview of hardware architectures for deep learning, Effective management of FPGA memory resources, optimizing algorithms and data representation for FPGA arithmetic resources, Integrating hardware and software.

Course outcomes

Students are able to

- CO1: Understand the context of convolutional neural networks and deep learning algorithms.
- CO2: Know how to use convolution in deep learning techniques.
- CO3: Understand the necessity and importance of light weight models with low complexity through specialized hardware architecture
- CO4: Know how to optimize hardware performance in deep neural network applications.
- CO5: Discuss, suggest and evaluate specialised hardware architectures to implement deep learning algorithms in FPGA and utilise deep learning concepts in resource constrained reliable systems.

| | | |
|--------------------------|----------|-----------------------------------|
| Course Code | : | EC640 |
| Course Title | : | Image and Video Processing |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE LEARNING OBJECTIVE

- The course aims to equip students with basic image and video processing techniques.

COURSE CONTENTS

Image Formation and Representation: 3D to 2D projection, photometric image formation, trichromatic colour representation, video format (SD, HD, UHD, HDR), contrast enhancement (concept of histogram, nonlinear mapping, histogram equalization)

Review of 1D Fourier transform and convolution: Concept of spatial frequency. Continuous and Discrete Space 2D Fourier transform. 2D convolution and its interpretation in frequency domain. Implementation of 2D convolution. Separable filters. Frequency response. Linear filtering (2D convolution) for noise removal, image sharpening, and edge detection. Gaussian filters, DOG and LOG filters as image.

Geometric mapping and Feature detection: Geometric mapping (affine, homography), Feature based camera motion estimation (RANSAC). Image warping. Image registration. Panoramic view stitching, Feature detection (Harris corner, scale space, SIFT), feature descriptors (SIFT). Bag of Visual Word representation for image classification.

Motion estimation: optical flow equation, optical flow estimation (Lucas-Kanade method, KLT tracker); block matching, multi-resolution estimation. Deformable registration (medical applications), Moving object detection (background/foreground separation): Robust PCA (low rank + sparse decomposition). Global camera motion estimation from optical flows. Video stabilization. Video scene change detection.

Video Coding: block-based motion compensated prediction and interpolation, adaptive spatial prediction, block-based hybrid video coding, rate-distortion optimized mode selection, rate control, Group of pictures (GoP) structure, tradeoff between coding efficiency, delay, and complexity, depth from disparity, disparity estimation, view synthesis. Multiview video compression. Depth camera (Kinect). 360 video camera and view stitching.

COURSE OUTCOMES

Students are able to

- CO1: Understand the concept of image formation and representation
- CO2: Know the need of transformation and convolution
- CO3: Understand the necessity and importance of feature detection and geometric mapping
- CO4: Know how to do motion estimation in video
- CO5: To understand the basic ideas of video coding

|--------------------------|----------|---|
| Course Code | : | EC641 |
| Course Title | : | Automated Test Engineering for Electronics |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE CONTENT

Printed Circuit Boards (PCBs) – types of PCB – multilayer PCBs – Plated through Hole Technology (PTH) - Surface Mount Technology (SMT) – Ball Grid Array (BGA) Technology. Bare PCB electrical test concepts, Loaded PCB Visual inspection, Automated Optical inspection systems, X-Ray inspection systems- Measuring Passive components – 2 wire, 3 wire, 4 wire and 6 wire measurement concepts, Guarding techniques, Shorts location, Most common manufacturing defects, Automated Manufacturing defect analyzers, Nodal Impedance / analog signature analysis. Flying probe testers.

Concepts of PCB Trouble-shooting, Symptom recognition, Bracketing technique, Failure types and fault causes, Manual Trouble shooting, Use of DMM, Oscilloscope, Signal Generators, Logic Probes, Logic Pulsers, Logic Analyzers, Automated Test Techniques – CPU Emulation technique, ROM Emulation, In-Circuit Comparators, In- Circuit Emulators, Functional Testing of Digital ICs, Library models, Concepts of In-circuit Testing, - Back Driving technique – international defence standards - Auto Compensation, In-Circuit Test of Open collector / Emitter Devices, Tri-State, Bi-Directional Devices, Concepts of Digital Guarding, Analog and Mixed Signal ICs Test, advantages and limitations of in-circuit testing, AC – DC Parametric testing, –Advanced test techniques- Boundary Scan Test , Learn and compare technique – digital signatures, Bus Cycle Signature Test , Analog signatures.

ATE system components, Main Test Vector processor, Digital Subsystem, Pin Electronics, Programmable drive and threshold levels, RAM behind each pin, Controlling slew rate, Skew between channels, Data formats, Digital and analog simulation, Test Vector Generation, Fault simulation, Fault coverage, Test Languages, Verilog, VHDL, Automatic compare, Analog Sub system, Digital and analog matrix switch circuits, digital and analog highways, Integration of JTAG, Boundary Scan Test, BSDL, External Instrumentation, Functional and Timing tests. Concepts of Test Program (T.P) Generation. Commercially available off the shelf Test Equipment's (COTS)

Board Functional Test (BFT) techniques – Go-No-go Test – Diagnostic Test, Reliability Test, Thermal Shock Test, Full functional Edge to edge test, Cluster Test – Guided Probe Backtracking Technique – Simulators – Online and Offline Simulation - Fault Simulation– Comprehensiveness of Board program – Fault Dictionary– Analysis – BS and Non-BS device testing— Sample board programming and testing – BS interconnect and simulating faults - External Instrumentation used for board testing – PXI Instrumentation – Integration of PXI instruments for testing

Design for testability (DFT) and Design for manufacturability (DFM) - Basics of ATPG, – Fault Models — Design considerations for edge functional test, Design considerations for Bus Cycle Signature Test, Design considerations for Boundary Scan Test, Built-in Self-Test, Modular Design– ATE for test - DFM - Manufacturing phases in industry oriented Production process – strategies – new strategy - benefits of new strategies

Reference Books:

1. *Test Engineering for Electronic Hardware* – S R Sabapathi, Qmax Test Equipments P Ltd., 2011
2. *Practical Electronic Fault Finding and Troubleshooting* - Robin Pain Newnes, Reed Educational and professional publishing Ltd., 1996
3. *The Fundamentals of Digital Semiconductor Testing*, Floyd, Pearson Education India, Sep-2005
4. *Building a Successful Board Test Strategy*-Stephen F Scheiber-Butterworth Heinemann

COURSE OUTCOMES

Students are able to

CO1: Understand PCB and various manufacturing techniques.

CO2: Understand common PCB failure detection techniques.

CO3: Understand the various ATE system components.

CO4: Know different board functional test techniques.

CO5: Understand the basic considerations for design manufacturability and testability.

| | | |
|--------------------------|---|---|
| Course Code | : | EC654 |
| Course Title | : | Electronic Design Automation Tools |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

Course Learning Objective

- To make the students exposed to Front end and Back end VLSI CAD tools.

Course Content

OS Architecture: System settings and configuration. Introduction to UNIX commands, Handling directories, Filters and Piping, Wildcards and Regular expression, Power Filters and Files Redirection. Working on Vi editor, Basic Shell Programming, TCL Scripting language.

Circuit simulation using Spice - circuit description. AC, DC and transient analysis. Advanced spice commands and analysis. Models for diodes, transistors and Opamp. Digital building blocks. A/D, D/A and sample and hold circuits. Design and analysis of mixed signal circuits.

Synthesis and simulation using HDLs-Logic synthesis using Verilog. Memory and FSM synthesis. Performance driven synthesis, Simulation- Types of simulation. Static timing analysis. Formal verification. Switch level and transistor level simulation.

System Verilog- Introduction, Design hierarchy, Data types, Operators and language constructs. Functional coverage, Assertions, Interfaces and test bench structures.

Analog/Mixed Signal Modelling and Verification: Analog/Mixed signal modelling using Verilog-A and Verilog-AMS. Event Driven Modelling: Real number modelling of Analog/Mixed blocks modelling using Verilog-RNM/System Verilog. Analog/Digital Boundary Issues: boundary issues coverage. Introduction to Universal Verification Methodology (UVM).

Text Books

1. M.J.S.Smith, "Application Specific Integrated Circuits", Pearson, 2008.
2. M.H.Rashid, "Spice for Circuits and Electronics using Pspice", 2nd Edition, PHI.
3. S.Sutherland, S. Davidmann and P. Flake, "System Verilog for Design", 2nd Edition, Springer, 2006.

Reference Books

1. H.Gerez, "Algorithms for VLSI Design Automation", John Wiley, 1999.
2. Z. Dr Mark, "Digital System Design with System Verilog", Pearson, 2010.
3. Sharon Rosenberg and Kathleen Meade, "A Practical Guide to Adopting the Universal Verification Methodology (UVM)", 2nd edition, 2010.

Course outcomes

After successful completion of the course the students are able to

CO1: execute the special features of VLSI back end and front end CAD tools and UNIX shell script

CO2: write Pspice code for any electronics circuit and to perform monte-carlo analysis and sensitivity/worst case analysis.

CO3: design synthesizable Verilog and VHDL code.

CO4: explain the difference between Verilog and system Verilog and are able to write system Verilog code.

CO5: Model Analog and Mixed signal blocks using Verilog A and Verilog AMS.

| | |
|--------------------------|--------------------------|
| Course Code | : EC656 |
| Course Title | : Design of ASICs |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVES

- To prepare the student to be an entry-level industrial standard ASIC or FPGA designer.
- To give the student an understanding of issues and tools related to ASIC/FPGA design and implementation.
- To give the student an understanding of basics of System on Chip and Platform based design.
- To give the student an understanding of High performance algorithms

COURSE CONTENT

Introduction to Technology, Types of ASICs, VLSI Design flow, Design and Layout Rules, Programmable ASICs - Antifuse, SRAM, EPROM, EEPROM based ASICs. Programmable ASIC logic cells and I/O cells. Programmable interconnects. Advanced FPGAs and CPLDs and Soft-core processors.

ASIC physical design issues, System Partitioning, Floorplanning and Placement. Algorithms: K-L, FM, Simulated annealing algorithms. Full Custom Design: Basics, Needs & Applications. Schematic and layout basics, Full Custom Design Flow.

Semicustom Approach: Synthesis (RTL to GATE netlist) - Introduction to Constraints (SDC), Introduction to Static Timing Analysis (STA). Place and Route (Logical to Physical Implementation): Floorplan and Power-Plan, Placement, Clock Tree Synthesis (clock planning), Routing, Timing Optimization, GDS generation.

Extraction, Logical equivalence and STA: Parasitic Extraction Flow, STA: Timing Flow, LEC: Introduction, flow and Tools used. Physical Verification: Introduction, DRC, LVS and basics of DFM.

System-On-Chip Design - SoC Design Flow, Platform-based and IP based SoC Designs, Basic Concepts of Bus-Based Communication Architectures. High performance algorithms for ASICs/ SoCs as case studies – Canonic Signed Digit Arithmetic, KCM, Distributed Arithmetic, High performance digital filters for sigma-delta ADC.

Text Book

1. *M.J.S. Smith : Application Specific Integrated Circuits, Pearson, 2003*
2. *Sudeep Pasricha and NikilDutt, On-Chip Communication Architectures System on Chip Interconnect, Elsevier, 2008*

Reference Books

1. *H.Gerez, Algorithms for VLSI Design Automation, John Wiley, 1999*
2. *Jan.M.Rabaey et al, Digital Integrated Circuit Design Perspective (2/e), PHI 2003*
3. *David A.Hodges, Analysis and Design of Digital Integrated Circuits (3/e), MGH 2004*
4. *Hoi-Jun Yoo, Kangmin Leeand Jun Kyong Kim, Low-Power NoC for High-Performance SoC Design, CRC Press, 2008*
5. *An Integrated Formal Verification solution DSM sign-off market trends, www.cadence.com.*
6. *Recent literature in Design of ASICs.*

COURSE OUTCOMES

Students able to

CO1: demonstrate VLSI tool-flow and appreciate FPGA and CPLD architectures.

CO2: understand the issues involved in ASIC design, including technology choice, design management and tool-flow.

CO3: understand the algorithms used for ASIC construction.

CO4: understand Full Custom Design Flow and Tool used.

CO5: understand Semicustom Design Flow and Tool used - from RTL to GDS and Logical to Physical Implementation

| | |
|--------------------------|--|
| Course Code | : EC662 |
| Course Title | : Modeling and Synthesis with Verilog HDL |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVES

- To design combinational, sequential circuits using Verilog HDL.
- To understand behavioral and RTL modeling of digital circuits
- To verify that a design meets its timing constraints, both manually and through the use of computer aided design tools
- To simulate, synthesize, and program their designs on a development board
- To verify and design the digital circuit by means of Computer Aided Engineering tools which involves in programming with the help of Verilog HDL.

COURSE CONTENT

Hardware modeling with the verilog HDL. Encapsulation, modeling primitives, different types of description.

Logic system, data types and operators for modeling in verilog HDL. Verilog Models of propagation delay and net delay path delays and simulation, inertial delay effects and pulse rejection.

Behavioral descriptions in verilog HDL. Synthesis of combinational logic.

HDL-based synthesis - technology-independent design, styles for synthesis of combinational and sequential logic, synthesis of finite state machines, synthesis of gated clocks, design partitions and hierarchical structures.

Synthesis of language constructs, nets, register variables, expressions and operators, assignments and compiler directives. Switch-level models in verilog. Design examples in verilog.

Text Books

1. *M.D.Ciletti, "Modeling, Synthesis and Rapid Prototyping with the Verilog HDL", PHI, 1999.*
2. *S. Palnitkar, "Verilog HDL – A Guide to Digital Design and Synthesis", Pearson, 2003.*

Reference Books

1. *J Bhaskar, "A Verilog HDL Primer (3/e)", Kluwer, 2005.*
2. *M.G.Arnold, "Verilog Digital – Computer Design", Prentice Hall (PTR), 1999.*
3. *Recent literature in Modeling and Synthesis with Verilog HDL.*

COURSE OUTCOMES

Students are able to

- CO1: understand the basic concepts of verilog HDL
- CO2: model digital systems in verilog HDL at different levels of abstraction
- CO3: know the simulation techniques and test bench creation.
- CO4: understand the design flow from simulation to synthesizable version
- CO5: get an idea of the process of synthesis and post-synthesis

| | | |
|--------------------------|----------|---|
| Course Code | : | EC663 |
| Course Title | : | Optimizations of Digital Signal Processing Structures for VLSI |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- To understand the various VLSI architectures for digital signal processing.
- To know the techniques of critical path and algorithmic strength reduction in the filter structures.
- To enable students to design VLSI system with high speed and low power.
- To encourage students to develop a working knowledge of the central ideas of implementation of DSP algorithm with optimized hardware.

COURSE CONTENT

An overview of DSP concepts, Pipelining of FIR filters. Parallel processing of FIR filters. Pipelining and parallel processing for low power, Combining Pipelining and Parallel Processing.

Transformation Techniques: Iteration bound, Retiming, Folding and Unfolding

Pipeline interleaving in digital filters. Pipelining and parallel processing for IIR filters. Low power IIR filter design using pipelining and parallel processing, Pipelined adaptive digital filters.

Algorithms for fast convolution: Cook-Toom Algorithm, Cyclic Convolution. Algorithmic strength reduction in filters and transforms: Parallel FIR Filters, DCT and inverse DCT, Parallel Architectures for Rank-Order Filters.

Synchronous pipelining and clocking styles, clock skew and clock distribution in bit level pipelined VLSI designs. Wave pipelining, constraint space diagram and degree of wave pipelining, Implementation of wave-pipelined systems, Asynchronous pipelining.

Text Book

1. *K.K.Parhi, VLSI Digital Signal Processing Systems, John-Wiley, 2007*

Reference Books

1. *U. Meyer -Baese, Digital Signal Processing with FPGAs, Springer, 2004*
2. *Wayne Burlison, Konstantinos Konstantinides, Teresa H. Meng, VLSI Signal Processing, 1996.*
3. *Richard J. Higgins, Digital signal processing in VLSI, 1990.*
4. *Sun Yuan Kung, Harper J. Whitehouse, VLSI and modern signal processing, 1985*
5. *Magdy A. Bayoumi, VLSI Design Methodologies for Digital Signal Processing, 2012*
6. *Earl E. Swartzlander, VLSI signal processing systems, 1986.*
7. *Recent literature in Optimizations of Digital Signal Processing Structures for VLSI.*

COURSE OUTCOMES

Students are able to

- CO1: understand the overview of DSP concepts and design architectures for DSP algorithms.
- CO2: improve the overall performance of DSP system through various transformation and optimization techniques.
- CO3: perform pipelining and parallel processing on FIR and IIR systems to achieve high speed and low power.
- CO4: optimize design in terms of computation complexity and speed.
- CO5: understand clock based issues and design asynchronous and wave pipelined systems

| | | |
|--------------------------|----------|------------------------|
| Course Code | : | EC664 |
| Course Title | : | Cognitive Radio |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- This subject introduces the fundamentals of multi rate signal processing and cognitive radio.

COURSE CONTENT

Filter banks-uniform filter bank. Direct and DFT approaches. Introduction to ADSL Modem. Discrete multitone modulation and its realization using DFT. QMF. STFT. Computation of DWT using filter banks.

DDFS- ROM LUT approach. Spurious signals, jitter. Computation of special functions using CORDIC. Vector and rotation mode of CORDIC.CORDIC architectures.

Block diagram of a software radio. Digital down converters and demodulators Universal modulator and demodulator using CORDIC. Incoherent demodulation - digital approach for I and Q generation, special sampling schemes. CIC filters. Residue number system and high speed filters using RNS. Down conversion using discrete Hilbert transform. Under sampling receivers, Coherent demodulation schemes.

Concept of Cognitive Radio, Benefits of Using SDR, Problems Faced by SDR, Cognitive Networks, Cognitive Radio Architecture. Cognitive Radio Design, Cognitive Engine Design,

A Basic OFDM System Model, OFDM based cognitive radio, Cognitive OFDM Systems, MIMO channel estimation, Multi-band OFDM, MIMO-OFDM synchronization and frequency offset estimation. Spectrum sensing to detect Specific Primary System, Spectrum Sensing for Cognitive OFDMA Systems.

Text Books

1. J. H. Reed, "Software Radio", Pearson, 2002.
2. U. Meyer – Baese, "Digital Signal Processing with FPGAs", Springer, 2004.
3. H. Arslan "Cognitive Radio, Software Defined Radio and Adaptive Wireless Systems", University of South Florida, USA, Springer, 2007.

Reference Books

1. S. K. Mitra, "Digital Signal processing", McGrawHill, 1998
2. K.C.Chen, R.Prasad, "Cognitive Radio Networks", Wiley, 2009-06-15.
3. T. W. Rondeau, C.W.Bostian, "Artificial Intelligence in Wireless Communications", 2009.
4. Tusi, "Digital Techniques for Wideband receivers", Artech House, 2001.
5. T. DarcChiueh, P. Yun Tsai," OFDM baseband receiver design for wireless communications", Wiley, 2007
6. Recent literature in Cognitive Radio.

COURSE OUTCOMES

Students are able to

- CO1: gain knowledge on multirate systems.
- CO2: develop the ability to analyze, design, and implement any application using FPGA.
- CO3: be aware of how signal processing concepts can be used for efficient FPGA based system design.
- CO4: understand the rapid advances in Cognitive radio technologies.
- CO5: explore DDFS, CORDIC and its applications.

| | |
|--------------------------|----------------------------|
| Course Code | : EC642 |
| Course Title | : Radiating Systems |
| Number of Credits | : 3 |
| Course Type | : Elective |

Course Learning Objective:

To prepare the students to understand the operating principles of various RF radiating systems
To design suitable antenna systems for various defined applications.

Course Content:

Review of antenna theory, dipoles, monopole and loop antennas

Linear and planar arrays, array synthesis, phased arrays

Helical antennas, radiation from apertures, aperture distribution

Horn, parabolic dish antennas, Yagi – Uda and log-periodic antennas

Microstrip antennas and arrays.

Text books:

- J.D. Karus, Antennas, McGraw Hill, 1988.
- Balanis, Antenna Theory - Analysis and design, John wiley, 1982.

Reference books:

- R.E. Collin, Antennas and radiowave propagation, McGraw Hill, 1985.
- R.C. Johnson and H. Jasik, Antenna Engineering Handbook, McGraw Hill, 1984.
- I.J. Bahl and P. Bhartia, Microstrip antennas, Artech house,1980
- G. Kumar and K. P. Ray, Broadband Microstrip Antennas, Artech House, 2003.

COURSE OUTCOMES

At the end of the course, students will be able to

CO1: Understand the various antenna parameters and fundamentals of radiating structures.

CO2: Understand the theory behind antenna array and its various configurations.

CO3: Learn broadband, End-fire, and aperture antennas

CO4: Learn various microstrip antenna and array structures.

CO5. Simulate, design, and optimize antennas for diverse applications using advanced tools and principles, factors like radiation patterns, gain, and efficiency.

| | |
|--------------------------|---|
| Course Code | : EC643 |
| Course Title | : Advanced Topics in 5G/B5G Wireless Communication |
| Number of Credits | : 3 |
| Course Type | : Elective |

Course Objectives:

The objective of this course is to help students get familiarized with the latest advancements in 5G and B5G Wireless Communications.

Course Content:

5G New radio frame structure, Numerology, Standardization, Review of orthogonal frequency division multiplexing, Review of multiple input multiple output systems.

Orthogonal time frequency space, non-orthogonal multiple access, Index modulation, Spatial modulation, intelligent reflecting surface, full duplex, physical layer security.

mmWAVE and massive MIMO: Spectrum, Beamforming, Angle of arrival, Angle of departure , Channel model, Precoding, Massive MIMO with imperfect CSI, Multi cell massive MIMO, Imperfect CSI, Pilot Contamination, Channel Estimation

Ultra Dense Networks: Poisson point Process, Device-to-Device Networks, Femtocells, Macrocells, Heterogeneous networks, Coverage, Rate of cellular networks.

Coding: Low density parity check code, Log likelihood ratio, soft input soft output decoder, Rate matching, Puncturing, Polar code, successive cancellation decoding of polar codes

Textbooks:

1. "5G NR: The Next Generation Wireless Access Technology", Erik Dahlman, Stefan parkvall, Johan Skold, Elsevier, 2E, 2020
2. "5G Physical Layer :Principals, Models and Technology Components", Ali Zaidi , et al., Academic Press, 2018.

Reference Books:

1. "Delay Doppler Communications -Principles and Applications", Yi Hong et al., Elsevier, 2022.
2. "OTFS - Orthogonal Time Frequency Space Modulation-A waveform for 6G", Surva Sekhar Das, Ramjee Prasad , River Publishers Series in Communication, 2021.
3. "LDPC Coded Modulations", M. Franceschini et al., Springer, 2009
4. "Massive MIMO Networks-Spectral, Energy and Hardware Efficiency", E.Bjornson et al., NOW Publishers, 2017
5. "Millimetre Wave Communications", M.G. Satche, MDPI Publishers, 2020
6. "Stochastic Geometry Analysis of Cellular Networks", B Blaszczyzyn et al., Cambridge University Press, 2018

COURSE OUTCOMES

CO1: Students will learn about the different 5G Modulation Waveforms

CO2: Students will learn about 5G Numerology, Frame structure.

CO3: Students will learn about mmwave , beamforming and massive MIMO systems

CO4: Students will learn to analyze ultra dense networks, derive coverage, rate of heterogeneous networks.

CO5: Students will learn about LDPC and polar codes.

| | | |
|--------------------------|----------|---|
| Course Code | : | EC644 |
| Course Title | : | Fundamentals of MIMO Wireless Communications |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

Course Objective:

To introduce students to the fundamentals of multiple antenna communication

Course Content:

Evolution of wireless system, Layered view of Transmitter and Receiver, Large scale propagation models, Path loss, Shadowing, Small scale model.

Coherence time, Doppler spectrum, Flat fading, Frequency selective fading, Coherence bandwidth, Delay Doppler characteristics

MIMO Channel, Statistical Properties, Maximal Ratio Combining, Selective Combining, Spatial Diversity, Probability of error in multiple antenna systems, Diversity gain, Transmit diversity.

Fundamentals of Information Theory, Entropy, Capacity, Source Coding, Huffman theorem

Capacity of deterministic MIMO channels, Capacity of channel unknown at transmitter, Capacity of channel known at transmitter, Capacity of random channel

Text books:

1. Principles of Mobile Communications by G. Stuber, Springer, 2nd ed..
2. Wireless Communications by A. Goldsmith, Cambridge

Reference Books:

1. Introduction to Space Time Wireless Communications by A. Paulraj, Nabar and Gore
2. Space Time Wireless Communication Systems, by Bolskei, Gesbert, et al.
3. MIMO wireless communications, by Biligeri, et al.
4. Space Time Coding, by Jafarkhani
5. LTE, UMTS and The Long Term Evolution by Sesia, Toufik and Baker
6. OFDM for Wireless Communications by R. Prasad
7. UMTS for LTE by Holma and Toshala
8. Adaptive PHY-MAC Design for Broadband Wireless Systems by R. Prasad, S. S. Das and Rahman
9. Single and Multi Carrier MIMO Transmission for Broadband Wireless Systems by R. Prasad, Rahman and S. S. Das.

Course Outcomes:

- CO1: Students will learn about the evolution of wireless systems.
 CO2: Students will learn about the basics of wireless channels.
 CO3: Students will learn about receive and transmit diversity schemes in MIMO.
 CO4: Students will learn to apply information theoretic concepts in a wireless system.
 CO5: Students will learn to derive the capacity of wireless systems under different scenarios.

| | | |
|-------------------|---|---------------------------------------|
| Course Code | : | EC645 |
| Course Title | : | Evolution of Air Interface Towards 5G |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

Course Objective:

This course will prepare students for research and make them industry ready to work in 5G technology.

Course Content:

Overview of 5G communication technology, Introduction to mm wave, Propagation models,

Introduction to MIMO, W-OFDM, F-OFDM, UFMC, FBMC, GFDM, adaptive OFDM, Modulation and coding in 5G

Propagation characteristics of 5G channel models, Basics of MIMO, Massive MIMO, Pilot contamination, Beamforming

Heterogeneous ultra dense networks, Femtocells, Small cells, Device-to-device

Non-orthogonal-multiple access, MIMO-NOMA, QoS provisioning for real time traffic.

Textbooks:

- 1.Evolution of Air Interface for 5G, River Publishers 2018, Journal and conference papers, white papers.
2. “5G NR: The Next Generation Wireless Access Technology”, Erik Dahlman, Stefan parkvall, Johan Skold, Elsevier, 2E, 2020

Course Outcomes:

- CO1: Students will learn about the development of 5G technology.
CO2: Students will learn about various waveforms used in 5G.
CO3: Students will learn about MASSIVE MIMO and the technologies associated with it.
CO4: Students will learn about heterogeneous networks.
CO5: Students will learn about non orthogonal multiple access.

| | |
|--------------------------|---|
| Course Code | : EC691 |
| Course Title | : Pattern Recognition and Computational Intelligence |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

- The subject aims to make the students to understand the mathematical approach for pattern recognition. and computational intelligence

COURSE CONTENT

Polynomial curve fitting – The curse of dimensionality - Decision theory - Information theory - The beta distribution - Dirichlet distribution-Gaussian distribution-The exponent family: Maximum likelihood and sufficient statistics -Non-parametric method: kernel-density estimators - Nearest neighbour methods.

Linear models for regression and classification: Linear basis function models for regression - Bias variance decomposition-Bayesian linear regression-Discriminant functions - Fisher's linear discriminant analysis (LDA) - Principal Component Analysis (PCA) - Probabilistic generative model - Probabilistic discriminative model- Independent Component Analysis (ICA)

Kernel methods: Dual representations-Constructing kernels-Radial basis function networks-Gaussian process-Maximum margin classifier (Support Vector Machine) –Relevance Vector Machines-Kernel-PCA, Kernel-LDA.

Mixture models: K-means clustering - Mixtures of Gaussian - Expectation-Maximization algorithm- Sequential models: Markov model, Hidden-Markov Model (HMM) - Linear Dynamical Systems (LDS).

Neural networks: Feed- forward Network functions-Network training - Error Back propagation - The Hessian Matrix - Regularization in Neural Network - Mixture density networks – Bayesian Neural Networks - Particle swarm optimization-Genetic algorithm-Ant colony optimization-Bacterial foraging-Simulated annealing – Fuzzy logic systems

Text Books

3. *C.M.Bishop, "Pattern recognition and machine learning", Springer, 2006*
4. *E.S.Gopi, "Pattern recognition and Computational intelligence using matlab, Transactions on computational science and computational intelligence, Springer, 2019*

Reference Books

5. *Sergious Theodoridis ,Konstantinos Koutroumbas, Pattern recognition, Elsevier, Fourth edition, 2009*
6. *Richard O.Duda, Peter.E.Hart, David G.Stork, "Pattern classification", Wiley, Second edition, 2016*
7. *E.S.Gopi, 'Algorithm collections for Digital signal Processing application using Matlab-Springer , 2007*
8. *Recent literature in the related topics*

COURSE OUTCOMES

Students are able to

- CO1: summarize the various techniques involved in pattern recognition
- CO2: identify the suitable pattern recognition techniques for the particular applications.
- CO3: categorize the various pattern recognition techniques into supervised and unsupervised.
- CO4: summarize the mixture models based pattern recognition techniques
- CO5: summarize the various computational intelligence techniques for pattern recognition

| | |
|--------------------------|--|
| Course Code | : EC692 |
| Course Title | : High Speed Communication Networks |
| Number of Credits | : 3 |
| Course Type | : Elective |

COURSE OBJECTIVE

To impart the students a thorough exposure to the layered architecture of communication network and to analyse the protocols adopted for traffic management, routing and QOS provisioning.

COURSE CONTENT

The need for a protocol architecture, The TCP/IP protocol architecture, Internetworking, Packet switching networks, Frame relay networks, Asynchronous Transfer mode (ATM) protocol architecture, High speed LANs.

Application of queuing theory to the analysis of performance of communication networks, Transport layer services-Principles of Reliable data transfer, Congestion control and flow control mechanism.

Virtual circuits and datagrams, Router architecture, Forwarding and addressing in the internet, Interior routing protocols, Exterior routing protocols and multicast.

IEEE 802.11 architecture and services, medium access control and physical layer, Wi-Fi protected access, IEEE 802.15 protocol architecture, Blue tooth and Personal Area Networks.

Quality of service in IP networks, Integrated and differentiated services, Protocols for QOS support-Resource reservation protocol, Multiprotocol label switching, Real time transport protocol. Simulation study on QoS provisioning in IP network.

Text Books

4. *W.Stallings, "High speed networks and internets" 2nd edition, Pearson education, 2002.*
5. *W. Stallings, "Wireless communication and networks" 2nd edition, Pearson publication, 2013.*
6. *J.F.Kurose and K.W.Ross", Computer networking" 3rd edition, Pearson education, 2005.*

Reference Books

4. *M. Schwartz, "Telecommunication networks, protocols, modelling and analysis", Pearson education, 2004*
5. *Jean walrand and Praveen Varaiya, " High performance communication networks", 2nd edition, Morgan Kaufmann publishers, 2005.*
6. *Saadawi, Ammar and El Hakeem, "Fundamentals of telecommunication Networks", Wiley series in Telecommunications and signal processing, 1994.*

COURSE OUTCOMES

Students are able to

- CO1: compare and analyse the fundamental principles of various high speed communication networks and their protocol architectures
- CO2: examine the performance modeling, congestion control issues and traffic management in IP networks
- CO3: compare and analyse the various routing protocols in IP networks
- CO4: study of various wireless LAN standards, Blue tooth and high data rate personal area networks
- CO5: examine quality of service in IP networks.

| | | |
|--------------------------|----------|---|
| Course Code | : | EC693 |
| Course Title | : | Electromagnetic Interference and Compatibility |
| Number of Credits | : | 3 |
| Course Type | : | Elective |

COURSE OBJECTIVE

- Electromagnetic interference (EMI) is a potential threat to the present day electronic systems. The main objective of the course is to provide insight into various sources of electromagnetic interferences and how to design an electronic product which is electromagnetically compatible with each other.

COURSE CONTENT

Introduction to EMI and EMC- Various EMC requirements and standards-Need for EMC and its importance in electronic product design - sources of EMI - few case studies on EMC.

Conducted and radiated emission -power supply line filters-common mode and differential mode current-common mode choke- switched mode power supplies. Shielding techniques- shielding effectiveness-shield behavior for electric and magnetic field -aperture-seams-conductive gaskets- conductive coatings

Grounding techniques- signal ground-single point and multi point grounding-system ground-common impedance coupling -common mode choke-Digital circuit power distribution and grounding.

Contact protection - arc and glow discharge-contact protection network for inductive loads-C, RC, RCD protection circuit- inductive kick back. RF and transient immunity-transient protection network- RFI mitigation filter-power line disturbance- ESD- human body model- ESD protection in system design.

PCB design for EMC compliance-PCB layout and stack up- multi layer PCB objectives- Return path discontinuities-mixed signal PCB layout. EMC pre compliance measurement-conducted and radiated emission test-LISN-Anechoic chamber.

Text Books:

3. *H. W. Ott, Electromagnetic Compatibility Engineering, 2nd edition, John Wiley & Sons, 2011, ISBN: 9781118210659.*
4. *C. R. Paul, Introduction to Electromagnetic Compatibility, 2nd edition, Wiley India, 2010, ISBN: 9788126528752*

Reference Book:

2. *K. L. Kaiser, Electromagnetic Compatibility Handbook, 1st edition, CRC Press, 2005. ISBN: 9780849320873*

COURSE OUTCOMES

Students are able to

- CO1: Understand the various sources of Electromagnetic interference
- CO2: Familiarize the fundamentals those are essential for product design with EMC compliance and various EMC standards
- CO3:.. would gain knowledge to understand the concept of Shielding and grounding related to product design.
- CO4:.. Design PCBs which are electromagnetically compatible
- CO5: understand and differentiate the various EMC pre compliance measurement
