M. Tech.

IN

POWER ELECTRONICS

CURRICULUM
(For students admitted in 2017-18)
CURRICULUM

The total minimum credits for completing the M.Tech. programme in Power Electronics is 64.

Course Code : MA603
Course Title : ADVANCED ENGINEERING MATHEMATICS
Number of Credits : 3
Course Type : Core

Course Objectives:
To learn essential optimization techniques for applying day to day problems. 
To learn the numerical techniques to solve ordinary differential equations. 
To learn the fundamentals of probability & statistical methods to apply in practical problems.

Introduction to Linear Programming Techniques- Unconstrained one dimensional optimization techniques - Necessary and sufficient conditions – Unrestricted search methods - Fibonacci and Golden section method.
Unconstrained n dimensional optimization techniques –Descent methods - Steepest descent, conjugate gradient. Constrained optimization Techniques - Necessary and sufficient conditions – Equality and inequality constraints - Kuhn-Tucker conditions - Gradient projection method
Random variable – two dimensional random variables – standard probability distributions – Binomial Poisson and normal distributions - moment generating function. 

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Apply appropriate optimization technique and analyze unconstrained one dimensional problems. 
2. Apply appropriate optimization technique and analyze unconstrained multi-dimensional problems. 
3. Appraise and evaluate constrained optimization problems related to Power Systems/Power Electronics by appropriate methods. 
5. demonstrate applications of probability theory

**Course Objectives:**
To give a systematic approach for transient and steady state analysis of all power electronic converters with passive and active loads

**Prerequisites:**
Power Electronics in UG

Analysis of power semiconductor switched circuits with R, L, RL, RC loads, d.c. motor load, battery charging circuit.

Single-Phase and Three-Phase AC to DC converters-half controlled configurations- operating domains of three phase full converters and semi-converters – Reactive power considerations.

Analysis and design of DC to DC converters- Control of DC-DC converters, Buck converters, Boost converters, Buck-Boost converters, Cuk converters

Single phase and Three phase inverters, Voltage source and Current source inverters, Voltage control and harmonic minimization in inverters.

AC to AC power conversion using voltage regulators, choppers and cyclo-converters, consideration of harmonics, introduction to Matrix converters.

**References Books:**

**Course Outcomes:**
Upon completion of the course, the students will be able to
1. To study and analyze transient response of basic power electronic circuits.
2. To understand the working of commonly used power Converters.
3. To analyze and design various power converter systems.
Course Code : EE653
Course Title  : LINEAR AND NON-LINEAR SYSTEMS THEORY
Number of Credits : 3
Course Type  : Core

Course Objectives:
The main objective of this course is to understand the fundamental of physical systems in terms of its linear and nonlinear models. Exploit the properties of linear systems such as controllability and observability.

Prerequisites: Basic control, Linear algebra

Introduction to state space modeling, modeling of physical systems. Solution to vector differential equations and state transition matrix.

State feedback controller design using pole placement. Observer design using Kalman filter algorithm. LQR and LQG controller design.

Introduction to nonlinear systems. Phase plane analysis of nonlinear system using linear approximation. Limit cycle and periodic solutions. Singular points (equilibrium points) and qualitative behavior near singular points.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand and model physical systems using state vectors
2. Analyze the stability of linear systems.
3. Design state feedback controllers and observers.
4. Understand and analyze non-linear systems using linear approximations.
5. Inspect the stability of non-linear systems by direct and indirect methods.
Course Code : EE657
Course Title : DESIGN AND SIMULATION OF POWER ELECTRONIC CIRCUITS LABORATORY
Number of Credits : 2
Course Type : Laboratory

Course Objectives:
The experiments will be conducted based on the following criteria. From the requirement of the load, the ratings of components such as power devices, L and C are identified using standard steady state equations. The performance is verified through simulations in relevant software and the design can be validated.

Prerequisites: Basics of Power electronics

List of Experiments
1) Single-phase and three-phase half-controlled rectifiers
2) Single-phase and three-phase fully-controlled rectifiers
3) Buck, Boost and Buck-Boost converters
4) Single-phase and three-phase Voltage-source inverters
5) Single-phase and three-phase Current-source inverters
6) Single-phase and three-phase AC voltage regulators

Course Outcomes:
On completion of the course, the students are expected to be able to:
1. Test and analyse the basic rectifier and inverter circuits
2. Test and analyse controlled circuits
Course Code : EE652
Course Title : SWITCHED MODE POWER CONVERSION
Number of Credits : 3
Course Type : Core

Course Objectives:
Understand the concepts, basic operation, steady-state operation of efficient switched-mode power conversion techniques, including basic circuit operation and magnetics design.

Prerequisites:
Power Converters

Basic concepts and steady-state analysis of second and higher order Switched Mode power converters: PWM DC-DC Converters (CCM and DCM) - operating principles, constituent elements, characteristics, comparisons and selection criteria

Dynamic Modelling and control of second and higher order switched Mode power converters: analysis of converter transfer functions, Design of feedback compensators, current programmed, frequency programmed and critical conduction mode control

Pulse Width Modulated Rectifiers: Properties of ideal rectifier, realization of near ideal rectifier, control of the current waveform, single phase and three-phase converter systems incorporating ideal rectifiers and design examples. Nonlinear phenomena in switched mode power converters: Bifurcation and Chaos.

References Books:

Course Outcomes:
Upon completion of the course, the students will be able to recognize and use the following concepts, ideas, and/or tools:
2. Design of Switched-Mode Converters, including selection of component values based on steady-state dc and ac ripple specifications.
3. Dynamic Modelling Development and Analysis for switched-mode dc-dc converters using averaging techniques, including the derivation and visualization of converter small-signal transfer functions.
4. Analysis and Design of Control Loops around switched-mode power converters using averaging small-signal dynamic models and classical control theory.
5. Become proficient with computer skills (e.g., PSPICE and MATLAB) for the analysis and design of switched-mode power converters.
Course Code : EE654
Course Title : POWER ELECTRONIC DRIVES
Number of Credits : 3
Course Type : Core

Course Objectives:
To introduce basic concepts of load and drive interaction, speed control concepts of ac and dc drives, speed reversal, regenerative braking aspects, design methodology.

Prerequisites:
A course in Power Electronics and electrical machines.

Conventional methods of D.C.motor speed control, single phase and three phase converter fed D.C motor drive. Power factor improvement techniques, four quadrant operation.

Chopper fed drives, input filter design. Braking and speed reversal of DC motor drives using choppers, multiphase choppers. PV fed DC drives.

Speed control of synchronous motors, field oriented control, load commutated inverter drives, switched reluctance motors and permanent magnet motor drives. Introduction to design aspects of machines.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand and analyze dc and ac motors supplied from different power converters.
2. Simulate and study motor characteristics with different converter configurations
3. Design and implement a prototype drive system.
Course Code: EE656  
Course Title: INDUSTRIAL CONTROL ELECTRONICS  
Number of Credits: 3  
Course Type: Core

Course Objectives: This course gives a comprehensive coverage of various control electronics used in the industries. This combines the analog and digital concepts together with Power Electronics for the design of the controllers. Further an overview of stepper motor and servomotor with associated control circuits is given.

Prerequisites: Fundamental knowledge about analog, digital and Power electronic circuits.

Review of switching regulators and switch mode power supplies, Uninterrupted power supplies- off-line and on-line topologies-Analysis of UPS topologies, solid state circuit breakers, solid-state tap-changing of transformer

Analog Controllers - Proportional controllers, Proportional – Integral controllers, PID controllers, derivative overrun, integral windup, cascaded control, Feed forward control, Digital control schemes, control algorithms, programmable logic controllers - sensors for high voltage and current applications

Signal conditioners-Instrumentation amplifiers – voltage to current, current to voltage, voltage to frequency, frequency to voltage converters; Isolation circuits – cabling; magnetic and electro static shielding and grounding

Opto-Electronic devices and control , electronic circuits for photo-electric switches-output signals for photo-electric controls; Applications of opto-isolation, interrupter modules and photo sensors; Fibre-optics; Bar code equipment, application of barcode in industry.

Stepper motors – types, operation, control and applications; servo motors- types, operation, control and applications – servo motor controllers – servo amplifiers – linear motor applications-selection of servo motor.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. To understand the working of various Power electronic circuits and components used in industrial applications.
2. To analyze various analog controllers and signal conditioning circuits.
3. To design control circuits for UPS and other industrial applications.

**Course Objectives:** Given design details fabricate and test the following power converters and drives

**Prerequisites:** Basics of Power converters

**List of Experiments**

1) Single-phase and three-phase half-controlled rectifiers
2) Single-phase and three-phase fully-controlled rectifiers
3) Buck, Boost and Buck-Boost converters
4) Single-phase and three-phase Voltage-source inverters
5) Single-phase and three-phase Current-source inverters
6) Single-phase and three-phase AC voltage regulators

**Course Outcomes:**
On completion of the course, the students are expected to be able to:

1. Test and analyse the basic rectifier and inverter circuits
2. Test and analyse controlled circuits
Course Code  :  EE601
Course Title  :  ADVANCED POWER SYSTEM ANALYSIS
Number of Credits  :  3
Course Type  :  Elective

Course Objectives:
To perform steady state analysis and fault studies for a power system of any size and also to explore the nuances of estimation of different states of a power system.

Prerequisites:
A basic knowledge on the subjects viz., Power System analysis, Matrix manipulations, Alternating machines and network analysis

Network modeling – Single phase and three phase modeling of alternators, transformers and transmission lines, Conditioning of Y Matrix — Incidence matrix method, Method of successive elimination, Triangular factorization – Sparse matrix

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. To construct models of power system components and apply them
2. To solve ac and dc load flow for single and there phase systems
3. To analyse the faults in the power system networks
4. To apply the concepts of optimization in power system.
5. To explain the concept of state estimation in power system and the role of statistics in state estimation.
Course Code : EE602
Course Title : POWER SYSTEM OPERATION AND CONTROL
Number of Credits : 3
Course Type : Elective

Course Objectives:
To understand the economics of power system operation with thermal and hydro units
To realize the requirements and methods of real and reactive power control in power system
To be familiar with the power system security issues and contingency studies

Prerequisites:
Optimization Techniques Advanced Power System Analysis

Automatic generation control - Review of LFC and Economic Dispatch control (EDC) using the three modes of control viz. Flat frequency – tie-line control and tie-line bias control – AGC implementation – AGC features - static and dynamic response of controlled two area system.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Develop generation dispatching schemes for thermal and hydro units
2. Apply control and compensations schemes on a power system
3. Adopt contingency analysis and selection methods to improve system security
Course Code : EE604
Course Title : ADVANCED POWER SYSTEM PROTECTION
Number of Credits : 3
Course Type : Elective

Course Objectives:
To facilitate the students understand the basic concepts and recent trends in power system protection. To enable the students design and work with the concepts of digital and numerical relaying.

Prerequisites:
Basic knowledge on short circuit analysis, digital system and signal processing.

General philosophy of protection - Classification and Characteristic function of various protective relays - basic relay elements and relay terminology - Development of relaying scheme

Bus bar protection - line protection - distance protection–long EHV line protection - Power line carrier protection

Reactor protection – Protection of boosters - capacitors in an interconnected power system

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Describe the characteristics of various relays
2. Develop analog and digital circuit based protection for alternator, transformer.
3. Describe various schemes of protection for busbar, transmission line, capacitor and boosters.
4. Illustrate the implementation flow of a numerical flow.
Course Code : EE661  
Course Title : FLEXIBLE AC TRANSMISSION SYSTEMS  
Number of Credits : 3  
Course Type : Elective

Course Objectives:  
To familiarize students with the transmission challenges of modern electrical power systems. The course will present the basic concepts, principles and operation of fast high power electronic controllers known as Flexible AC Transmission Systems (FACTS) that enhance power system stability and effectively increase transmission capacity thus yielding significantly higher flexibility of operation. The course will focus on concepts and applications various configurations of FACTs controllers. Both thyristor based and also voltage source converters based FACTS Controllers are discussed.

Prerequisites:  
Fundamentals of ac power transmission - transmission problems and needs - emergence of FACTS - FACTS control considerations - FACTS controllers  
Principles of shunt compensation – Variable Impedance type & switching converter type - Static Synchronous Compensator (STATCOM) configuration - characteristics and control  
Principles of static series compensation using GCSC, TCSC and TSSC – applications - Static Synchronous Series Compensator (SSSC)  
Principles of operation - Steady state model and characteristics of a static voltage regulators and phase shifters - power circuit configurations  
UPFC - Principles of operation and characteristics - independent active and reactive power flow control - comparison of UPFC with the controlled series compensators and phase shifters

Reference Books:  

Course Outcomes:  
Upon completion of the course, the students will be able to  
1. Identify the conditions in conventional power system where the installation of FACTS controllers or Devices becomes vital.  
2. Analyze the performance of a conventional transmission system and apply the principles of reactive power compensation for improvement.  
3. Illustrate the modes of operation of thyristor based and voltage source converter based FACTs controllers and explain the capabilities and modeling aspects.  
4. Analyze different series, shunt or combined series-shunt FACTs controllers and compute the performance when installed in a given transmission system.  
5. Compare the characteristics of different FACTs controllers and defend the choice of a particular controller to suit the given system/ scenario
Course Code : EE662  
Course Title : HIGH VOLTAGE DC TRANSMISSION  
Number of Credits : 3  
Course Type : Elective  

Course Objectives:  
To facilitate the students understand the basic concepts and recent trends in HVDC transmission system and its applications.  

Prerequisites:  
Basic knowledge in circuit analysis, Control Systems power system and Power Electronic devices and circuits.  

Introduction to HVDC transmission, Comparison between HVAC and HVDC systems - economic, technical and reliability, limitations, Types of HVDC links - monopolar, bipolar and homopolar links, Components of HVDC transmission system  
Analysis of HVDC Converters, Rectifier and Inverter operation of Graetz circuit without and with overlap. Output voltage waveforms and DC voltage in both rectifier and inverter operation, Equivalent circuit of HVDC link.  
Basic means of HVDC system control, desired features, power reversal, Basic controllers - constant ignition angle, constant current and constant extinction/ advance angle control, power control, high level controllers. Converter maloperations - misfire, arc through, commutation failure  
Harmonics in HVDC system - Characteristic and uncharacteristic harmonics - troubles due to harmonics – harmonic filters - active and passive filters - Reactive power control of converters, Protection issues in HVDC, over voltage and over current protection, voltage and current oscillations, DC reactor design, DC Circuit breakers  
Recent trends in HVDC transmission-CCC based HVDC system, VSC based HVDC system, Multi-terminal HVDC systems and HVDC system applications in wind power generation, Interaction between AC and DC systems  

Reference Books:  

Course Outcomes:  
Upon completion of the course, the students will be able to  
1. Appraise the need of HVDC technology for bulk power transmission and choose appropriate type of HVDC link and converter  
2. Analyze the operation of Graetz circuit as rectifier and inverter without and with overlap.  
3. Evaluate the operation and efficacy of different controllers and analyze the different faults in HVDC systems  
4. Discriminate and evaluate the issues related with harmonics, reactive power control and protection of HVDC system.  
5. Recognize and appraise the recent trends in HVDC transmission systems.
### Course Code
EE663

### Course Title
MICROCONTROLLER APPLICATIONS IN POWER CONVERTERS

### Number of Credits
3

### Course Type
Elective

---

#### Course Objectives:
Study the internal structure and operation of PIC 16F876 microcontroller and 8051 microcontroller; assembly language program for the generation of firing and control signals employing these microcontrollers.

#### Prerequisites:
Knowledge on any digital controller and power electronics may be desirable

Introduction to MPLAB IDE and PICSTART plus – Device Programming using MPLAB and PICSTART plus – generation of firing / gating pulses for typical power converters.

#### Reference Books:

#### Course Outcomes:
Upon completion of the course, the students will be able to

1. To understand the architecture of 8051 and 16F876 microcontrollers
2. To develop assembly language programs employing 8051 & 16F876 microcontrollers
3. To analyze the microcontroller programming using MPLAB and develop typical programs for power converter applications.
Course Code : EE664
Course Title : ADVANCED DIGITAL SIGNAL PROCESSING
Number of Credits : 3
Course Type : Elective

Course Objectives:
Review and understanding of discrete-time systems and signals. Discrete-Time Fourier Transform and its properties, the Fast Fourier Transform, design of Finite Impulse Response (FIR) and Infinite Impulse Response (IIR) filters, implementation of digital filters.

Prerequisites:
Signals and Systems, Circuit Theory

Classification of filter design - Design of IIR filters – Bilinear transformation technique – Impulse invariance method – Step invariance method.

FIR filter design – Fourier series method - Window function technique - Finite Word Length Effects

Introduction to Multirate Signal Processing - Decimation - Interpolation – Introduction to STFT WT

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand the basic of discrete-time signals, systems and Z-Transform ;
2. Perform discrete-time Fourier Transform and digital Fourier Transform;
3. Design different kinds of digital filters.
Course Code : EE665
Course Title : ADVANCED DIGITAL SYSTEM DESIGN
Number of Credits : 3
Course Type : Elective

Course Objectives: To impart the knowledge on the advanced topics of Digital systems, design aspects and testing of the circuits.

Prerequisites: Digital Electronics

Review of sequential circuits - Mealy & Moore Models - Analysis & Synthesis of Synchronous sequential circuits

Digital system design Hierachy - ASM charts - Hardware description language - Control logic Design

Reduction of state tables - State Assignments

Analysis and synthesis of Asynchronous sequential circuits - critical and non-critical races - Essential Hazard

Combinational and sequential circuit design with PLD’s - Introduction to CPLD’s & FPGA’s.

Fault classes and models – Stuck at faults, Bridging faults - Transition and Intermittent faults. Fault Diagnosis of combination circuits by conventional methods - Path sensitization technique - Boolean different method and Kohavi algorithm

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand the concepts of synchronous sequential circuits.
2. Formulate the state tables and ASM charts for digital system.
3. Design circuits using programmable logic devices.
4. Identify faults in the digital circuits.
5. Analyze and synthesize asynchronous sequential circuits.
Course Code : EE667
Course Title : ANALYSIS AND DESIGN OF ARTIFICIAL NEURAL NETWORKS
Number of Credits : 3
Course Type : Elective

Course Objectives: To apply artificial neural networks in various electrical and electronics engineering applications.

Prerequisites: Introduction to Electrical and Electronics Engineering, Basic mathematics and Probability

Pattern classification –Learning and generalization-structure of neural networks – ADA line and Mada line-perceptrons

Linear separability – Back propagation – XOR function-Back propagation algorithm-Hopfied and Hamming networks- Kohensen’s network-Boltzmann machine-in and out star network – Art 1 and Art 2 nets

Neuro adaptive control applications-ART architecture – Comparison layer – Recognition layer – ART classification process – ART implementation – Examples

Character recognition networks, Neural network control application, connectionist expert systems for medical diagnosis Self organizing maps

Applications of neural algorithms and systems -Character recognition networks, Neural network control application, connectionist expert systems for medical diagnosis

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. To explain the concepts of biological and artificial neural network.
2. To understand the different modes of operation in artificial neural network.
3. To discriminate the first generation and second generation neural networks.
4. To understand the third generation neural networks.
5. To apply neural network in pattern recognition, forecasting, control, clustering, data mining and decision making engineering problems.
Course Code : EE668  
Course Title : DIGITAL CONTROLLERS IN POWER ELECTRONICS APPLICATIONS  
Number of Credits : 3  
Course Type : Elective

Course Objectives:
To enrich the learner with digital controller concepts and its application in the field of Power Electronic Systems

Prerequisites:

Introduction to the C2xx DSP core and code generation - The components of the C2xx DSP core - Mapping external devices to the C2xx core - peripherals and Peripheral Interface - System configuration registers - Memory - Types of Physical Memory - Memory addressing Modes - Assembly Programming using C2xx DSP - Instruction Set - Software Tools

Pin Multiplexing (MUX) and General Purpose I/O Overview - Multiplexing and General Purpose I/O Control Registers - Introduction to Interrupts - Interrupt Hierarchy - Interrupt Control Registers - Initializing and Servicing Interrupts in Software

ADC Overview - Operation of the ADC in the DSP - Overview of the Event manager (EV) - Event Manager Interrupts - General Purpose (GP) Timers - Compare Units - Capture Units And Quadrature Enclosed Pulse (QEP) Circuitry - General Event Manager Information

Introduction to Field Programmable Gate Arrays – CPLD Vs FPGA – Types of FPGA - Xilinx XC3000 series - Configurable logic Blocks (CLB) - Input/Output Block (IOB) – Programmable Interconnect Point (PIP) – Xilinx 4000 series – HDL programming –overview of Spartan 3E and Virtex II pro FPGA boards-case study.

Controlled Rectifier - Switched Mode Power Converters - PWM Inverters - DC motor control - Induction Motor Control.

Reference Books:
2. XC 3000 series datasheets (version 3.1). Xilinx, Inc., USA, 1998
3. XC 4000 series datasheets (version 1.6). Xilinx, Inc., USA, 1999

Course Outcomes:
Upon completion of the course, the students will be able to
1. Will understand the architecture of DSP core and its functionalities.
2. Acquire knowledge on operation of interrupts and peripherals
3. Explore the possibilities of hardware implementation using PLDs and FPGAs.
4. Design of controllers for power converters.
Course Code: EE669  
Course Title: COMPUTER NETWORKING  
Number of Credits: 3  
Course Type: Elective

Course Objectives: This course provides an introduction to the computer networking fundamentals, design issues, functions and protocols of the network architecture.

Prerequisites: Data Structures and Communication Systems.

Data link layer - design issues, Data link protocols. Medium access sub layer - channel allocations, Multiple Access protocols, IEEE protocols.

Network layer - Design issues, routing algorithms, congestion control algorithms, QoS, Transport layer issues, Connection management.

Application layer – DNs, Electronic mail, World Wide Web, multimedia, Cryptography.

Internet transport protocols - TCP and UDP.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Describe the different layers of the network architecture models and their functions.
2. Appraise the need of the various protocols across different layers.
3. Suggest a particular routing protocol and congestion technique for an application.
Course Code : EE670  
Course Title : ELECTRICAL DISTRIBUTION SYSTEMS  
Number of Credits : 3  
Course Type : Elective  

Course Objectives:  
- To explain the principles of design and operation of electric distribution feeders and other components  
- To make the students to understand the distribution system expansion planning and reliability analysis procedures  

Prerequisites:  
Transmission and Distribution of Electrical Energy , Power System Analysis  

Distribution system - reliability analysis – reliability concepts – Markov model – distribution network reliability – reliability performance  

Distribution system expansion - planning – load characteristics – load forecasting – design concepts – optimal location of substation – design of radial lines – solution technique.  

Voltage control – Application of shunt capacitance for loss reduction – Harmonics in the system – static VAR systems – loss reduction and voltage improvement.  

System protection – requirement – fuses and section analyzers-over current - Under voltage and under frequency protection – coordination of protective device.  

Reference Books:  

Course Outcomes:  
Upon completion of the course, the students will be able to  
1. do loss calculation in distribution lines.  
2. select the protective components for distribution systems.  
3. Carry out planning and reliability analysis of electrical distribution systems.

**Course Objectives:**
This course is designed to expose students to fuzzy methods of analyzing problems which involve incomplete or vague criteria rather than crisp values. The course investigates requirements analysis, logical design, and technical design of components for fuzzy systems development.

**Prerequisites:**
Control Systems

Different faces of imprecision – inexactness, Ambiguity, Undecidability, Fuzziness and certainty, Probability and fuzzy logic, Intelligent systems.

Fuzzy sets and crisp sets - Intersections of Fuzzy sets, Union of Fuzzy sets, the complement of Fuzzy sets.

Methodology of fuzzy design - Direct & Indirect methods with single and multiple experts, Adaptive fuzzy control, Rule base design using dynamic response.

Fuzzy logic applications to engineering, Fuzzy decision making, Neuro-Fuzzy systems, Fuzzy Genetic Algorithms.

**Reference Books:**

**Course Outcomes:**
Upon completion of the course, the students will be able to

1. Assimilate the uncertainty concept.
2. Apply and analyze fuzzy sets for existing systems.
3. Develop fuzzy logic theory for linear and non-linear systems.
Course Code: EE672
Course Title: TRANSIENT OVER VOLTAGES IN POWER SYSTEMS
Number of Credits: 3
Course Type: Elective

Course Objectives:
To make the students familiar with the theoretical basis for various forms of over voltages such as lighting strokes, surges, switching transients etc., and to introduce some of the protection measures against such over voltages are described. Also to depict the necessity and methods for generating impulse voltages and currents.

Prerequisites:
Advanced Power System Analysis

Transients in electric power systems – Internal and external causes of over voltages – Lightning strokes – Mathematical model to represent lightning, Travelling waves in transmission lines – Circuits with distributed constants – Wave equations – Reflection and refraction of travelling waves – Travelling waves at different line terminations.

Switching transients – double frequency transients – abnormal switching transients – Transients in switching a three phase reactor - three phase capacitor

Voltage distribution in transformer winding – voltage surges-transformers – generators and motors

Transient parameter values for transformers, reactors, generators and transmission lines

Basic ideas about protection – surge diverters-surge absorbers - protection of lines and stations Modern lighting arrestors - Insulation coordination - Protection of alternators and industrial drive systems

Generation of high AC and DC-impulse voltages, currents - measurement using sphere gaps-peak voltmeters - potential dividers and CRO

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Recognize and construct different circuits representing lightning and travelling waves.
2. Analyze various switching transients in power systems.
3. Appraise voltage surges in different electrical machines.
4. Understand basic protection of machines, stations and lines.
5. Appreciate methods of generating and measuring A.C. and D.C., impulse voltages.
Course Code  : EE673  
Course Title  : RENEWABLE POWER GENERATION TECHNOLOGIES  
Number of Credits  : 3  
Course Type  : Elective  

Course Objectives:  
- This course makes the student aware of various forms of renewable energy  
- to understand in detail the wind energy conversion system and photovoltaic conversion system  

Prerequisites:  
Basic Electronics and Machines, Power Electronics  

Sun and Earth-Basic Characteristics of solar radiation-angle of sunrays on solar collector- Photovoltaic cell-characteristics-equivalent circuit-Photovoltaic modules and arrays  

PV Systems - Design of PV systems-Standalone system with DC and AC loads with and without battery storage-Grid connected PV systems-Maximum Power Point Tracking  

Wind energy - energy in the wind – aerodynamics - rotor types – forces developed by blades - Aerodynamic models – braking systems – tower - control and monitoring system - design considerations- power curve - power speed characteristics-choice of electrical generators  

Wind turbine generator systems - fixed speed induction generator-performance analysis- semi variable speed induction generator-variable speed induction generators with full and partial rated power converter topologies -isolated systems-self excited induction generator- permanent magnet alternator - performance analysis  

Hybrid energy systems - wind-diesel system-wind - PV system-micro hydro-PV system – biomass - PV-diesel system-geothermal-tidal and OTEC systems  

Reference Books:  

Course Outcomes:  
Upon completion of the course, the students will be able to  
1. Appraise the need and possibility of extracting solar energy and converting into electrical energy using PV cell.  
2. Design and analyze stand-alone and grid connected PV system.  
3. Describe the dynamics of wind turbine and electrical generator.  
4. Select and design suitable configuration of the wind energy conversion system based on application.  
5. Suggest, design and analyze hybrid energy systems.
Course Code : EE674
Course Title : POWER SYSTEM PLANNING AND RELIABILITY
Number of Credits : 3
Course Type : Elective

Course Objectives:
To acquire skills in planning and building reliable power system

Prerequisites: Power system analysis, Power system transmission and distribution, Matrices, Probability and Calculus

Transmission system reliability model analysis – average interruption rate - LOLP method - frequency and duration method

Two plant single load system - two plant two load system - load forecasting uncertainly interconnections benefits

Introduction to system modes of failure – the loss of load approach – frequency & duration approach – spare value assessment – multiple bridge equivalents

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. To explain the characteristics of loads, concepts of load forecasting and its types for power system planning.
2. To comprehend the significance of reliability in power system, various methods and tools used for reliability analysis.
3. To describe the concepts of reliability in generation and transmission system, and system interconnection.
4. To discriminate the different modes of system failure and to explain various approaches to assess power system failure.
Course Code : EE675
Course Title : MODELING AND ANALYSIS OF ELECTRICAL MACHINES
Number of Credits : 3
Course Type : Elective

Course Objectives: To give a systematic approach for modeling and analysis of all rotating machines under both transient and steady state conditions.

Prerequisites: Electromagnetic field theory, Vector algebra and fundamentals of all electrical rotating machines

Principles of Electromagnetic Energy Conversion, General expression of stored magnetic energy, co-energy and force/torque, example using single and doubly excited system.

Basic Concepts of Rotating Machines-Calculations of air gap mmf and per phase machine inductance using physical machine data; Voltage and torque equation of dc machine.

Three phase symmetrical induction machine and salient pole synchronous machines in phase variable form; Application of reference frame theory to three phase symmetrical induction and synchronous machines, dynamic direct and quadrature axis model in arbitrarily rotating reference frames.

Special Machines - Permanent magnet synchronous machine: Surface permanent magnet (square and sinusoidal back emf type) and interior permanent magnet machines. Construction and operating principle, dynamic modeling and self controlled operation; Analysis of Switch Reluctance Motors

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand principles of energy conversion
2. Analyze basic concepts of rotating machines.
3. Construct machine models based on different reference frames.
4. Analyze and synthesize equivalent circuit parameters for synchronous and asynchronous machines.
5. Understand and analyze special machines.
Course Code : EE676
Course Title : POWER QUALITY
Number of Credits : 3
Course Type : Elective

Course Objectives: Understand the various power quality phenomenon, their origin and monitoring and mitigation methods. Understand the effects of various power quality phenomenon in various equipment.

Prerequisites: Power Systems, Signals and Systems.

Electric power quality phenomena - IEC and IEEE definitions - power quality disturbances - voltage fluctuations-transients-unbalance-waveform distortion-power frequency variations.

Power Quality conditioners – shunt and series compensators - DStatcom - Dynamic voltage restorer - unified power quality conditioners - case studies

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand different types of power quality problems with their source of generation.
2. Design different methodologies for detection, classification and mitigation of power quality problems.
3. Expected to practically design active & passive filters for harmonic elimination.
Course Code : EE677
Course Title : POWER SYSTEM RESTRUCTURING AND PRICING
Number of Credits : 3
Course Type : Elective

Course: To understand the electricity power business and technical issues in a restructured power system in both Indian and world scenario.

Objectives: Power system Analysis, Power system Transmission and distribution.

Prerequisites: Power system Analysis, Power system Transmission and distribution.

Introduction – Market Models – Entities – Key issues in regulated and deregulated power markets; Market equilibrium- Market clearing price- Electricity markets around the world.

Operational and planning activities of a Genco - Electricity Pricing and Forecasting - Price Based Unit Commitment Design - Security Constrained Unit Commitment design. - Ancillary Services for Restructuring- Automatic Generation Control (AGC).

Introduction-Components of restructured system- Transmission pricing in Open-access system- Open transmission system operation; Congestion management in Open-access transmission systems- FACTS in congestion management - Open-access Coordination Strategies; Power Wheeling- Transmission Cost Allocation Methods

Open Access Distribution - Changes in Distribution Operations- The Development of Competition – Maintaining Distribution Planning

Power Market Development – Electricity Act, 2003 - Key issues and solution; Developing power exchanges suited to the Indian market - Challenges and synergies in the use of IT in power- Competition- Indian power market- Indian energy exchange- Indian power exchange- Infrastructure model for power exchanges- Congestion Management-Day Ahead Market- Online power trading.

Reference Books:

Course Outcomes:

Upon completion of the course, the students will be able to
1. To explain the deregulated electricity market models functioning around the world.
2. To understand the operational and planning activities in power generation.
3. To solve transmission pricing and understand strategies in congestion management.
4. To study the development of competition in electricity distribution companies.
5. To outline the salient features of Indian Electricity Act and the formation and operation of Indian power exchanges.
Course Code : EE678
Course Title : COMPUTER RELAYING AND WIDE AREA MEASUREMENT SYSTEMS
Number of Credits : 3
Course Type : Elective

Course Objectives:
The goal of this course is to provide basic knowledge on computer relaying and its applications in wide area measurement systems. The internal architecture and algorithms employed in a numerical relays will be discussed. Understanding about wide area measurement systems, mathematical background for relaying algorithms and also examining line relaying algorithms for protection of power system components.

Prerequisites:
Digital Signal Processing, Power system protection

UNIT – I
Introduction to Computer Relaying
Introduction to DSP, Use of computer relay, Analog to Digital Converters, Sampling, Anti – aliasing filters. Evolution of power system relaying from electromagnetic to static to computer relaying; Relay operating principles for computer relaying; Expected benefits of computer relaying, Computer relay architecture.

UNIT – II
Protection of Transmission Line using Computer Relaying
Three zone protection of transmission line, algorithms for impedance calculations - Mann-Morrison algorithm - Three sample technique - Two sample technique - First and second derivative algorithms - Numerical integration methods.

UNIT –III
Protection of power system equipment using Frequency domain techniques
Problems associated with differential protection of transformer and bus-bar, magnetic inrush current, LSQ algorithm, Fourier analysis of transformer protection.

UNIT –IV
Phasor Measurement Units
Introduction to Phasor measurement units (PMUS), global positioning system (GPS), Functional requirements of PMUs and PDCs, phasor estimation of nominal frequency inputs

UNIT –V
PMU Applications

Reference Books:

Course Outcomes:
Upon finishing the course, students are expected to accomplish the following objectives:
1. Demonstrate knowledge of fundamental aspects of the theories, principles and practice of computer relaying
2. Understand the application of numerical relay to power system equipment protection
3. Understand and design wide area measurement systems application in Smart grid
Course Code : EE679
Course Title : SWARM INTELLIGENT TECHNIQUES
Number of Credits : 3
Course Type : Elective

Course Objectives:
To cater the knowledge of swarm intelligent techniques like genetic algorithm, particle swarm optimization, artificial bee colony algorithms, artificial immune systems, firefly algorithms, cuckoo search algorithms etc. and their applications in electrical engineering

Prerequisites:
Basic Electrical and Electronics, Engineering mathematics

Introduction to intelligent systems- Soft computing techniques- Conventional Computing versus Swarm Computing; Classification of meta-heuristic techniques- single solution based and population based algorithms – exploitation and exploration in population based algorithms; Properties of Swarm intelligent Systems; Application domain-discrete and continuous problems- single objective and multi-objective problems .

Evolutionary programs – genetic algorithms, genetic programming and evolutionary programming; Genetic Algorithm versus Conventional Optimization Techniques; Genetic representations and selection mechanisms; Genetic operators- different types of crossover and mutation operators; Optimization problems using GA-discrete and continuous- single objective and multi-objective problems; Procedures in evolutionary programming.

Biological ant colony system - artificial ants and assumptions; Stigmergic communications; Pheromone updating- local-global; Pheromone evaporation; Pseudo- probabilistic decision making. Travelling salesman problem- ant System-ant quantity- ant density- ant cycle-ant colony system. ACO models-touring ant colony system-max min ant system-concept of elistic ants –continuous and discrete ACO; Bird flocking and Fish Schooling – anatomy of a particle- equations based on velocity and positions-PSO topologies-swarm types- control parameters-constriction coefficient; ACO and PSO applications in electrical engineering applications.

Task partitioning in honey bees-balancing foragers and receivers; artificial bee colony (ABC) algorithms-binary ABC and continuous ABC algorithms; Bacterial foraging techniques-taxes-elimination-dispersals-bacteria motility and swarming; Biological immune systems and artificial immune systems-affinity measures- representations; Basic immune models and algorithms-bone marrow models-negative selection algorithms-clonal selection algorithms-somatic hyper mutation-immune network models-applications in electrical engineering.

Differential search algorithms, harmony Search algorithms, cuckoo search algorithms, firefly algorithms, gravitational search Algorithms, Hybrid swarm intelligent systems; Applications in electrical engineering.
Reference Books:
6. IEEE Transaction research papers

Course Outcomes:
Upon completion of the course, the students will be able to
1. To discriminate the capabilities of bio-inspired system and conventional methods in solving optimisation problems.
2. To examine the importance of exploration and exploitation swarm intelligent system to attain near global optimal solution.
3. To distinguish the functioning of various swarm intelligent systems.
4. To explain and employ various bio-inspired algorithms for engineering applications.
Course Code: EE680
Course Title: SMART GRID TECHNOLOGIES
Number of Credits: 3
Course Type: Elective

Course Objectives:

- To understand the need and concept of Smart Grid.
- To study different EMS and DMS functions and smart meters.
- To get familiarized with the communication networks for Smart Grid applications

Prerequisites: Fundamentals of Power Distribution Systems.

Introduction - Evolution of Electric Grid, Smart Grid Concept - Definitions and Need for Smart Grid – Functions – Opportunities – Benefits and challenges, Difference between conventional & Smart Grid, Technology Drivers.

Introduction to Smart Meters – Advanced Metering infrastructure (AMI), AMI protocols – Standards and initiatives, Demand side management and demand response programs, Demand pricing and Time of Use, Real Time Pricing, Peak Time Pricing.

Elements of communication and networking – architectures, standards, PLC, Zigbee, GSM, BPL, Local Area Network (LAN) - House Area Network (HAN) - Wide Area Network (WAN) - Broadband over Power line (BPL) - IP based Protocols - Basics of Web Service and CLOUD Computing, Cyber Security for Smart Grid.

Reference Books:

Course Outcomes:

Upon completion of the course, the students will be able to

1. Get acquainted with the smart resources, smart meters and other smart devices.
2. Describe how modern power distribution system functions.
3. Identify suitable communication networks for smart grid applications.
Course Code          : EE681
Course Title         : ELECTRICAL SYSTEMS IN WIND ENERGY
Number of Credits    : 3
Course Type          : Elective

Course Objectives:  To introduce the various electrical generators and appropriate power electronic controllers employed in wind energy systems. To teach the students the steady-state analysis and operation of different existing configurations of electrical systems in wind energy and also the recent developments taking place in this field.

Prerequisites:      Electrical machines and power electronics.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Explain the operation of electrical generators used in wind energy systems
2. Carry out the steady-state analysis of electrical systems
3. Design and implement the suitable closed-loop controller for specific applications.
Course Code : EE683
Course Title : EMBEDDED PROCESSORS AND CONTROLLERS
Number of Credits : 3
Course Type : Elective

Course Objectives:
To enrich the learner with processor and controller design concepts with special concentration on system-on-chip and system-on-programmable chip.

Prerequisites:
Digital Electronics, Microprocessors & Microcontrollers, Computer Architecture

ARM7TDMI – architecture overview - processor modes – data types – Registers – program status registers – Simple programs

Introduction to Design of Systems on a chip – Core architectures for Digital media and compilation techniques – Microsystems technology and applications – Hardware/software co-design concepts.

Multi-core System-on-Chip (McSoC) design – Application specific McSoC design – QueueCore Architecture – Synthesis and evaluation results – Reconfigurable multi-core architectures.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand the insights and functionality of MSP430 microcontroller.
2. Acquire knowledge on peripherals of MSP430.
3. Appraise the blocks of ARM processor architecture.
4. Adapt the concepts of SoC and hardware/software design
5. Recognize the use of multi-core SoC.
Course Code : EE684  
Course Title : DISTRIBUTED GENERATION AND MICRO-GRIDS  
Number of Credits : 3  
Course Type : Elective

Course Objectives:  
To understand the planning and operational issues related to Distributed Generation and Micro-grids.

Prerequisites:  
The students are preferred to have a basic knowledge in Power System Analysis and Distribution Systems

Need for Distributed generation, renewable sources in distributed generation, current scenario in Distributed Generation, Planning of DGs – Siting and sizing of DGs – optimal placement of DG sources in distribution systems.

Grid integration of DGs – Different types of interfaces - Inverter based DGs and rotating machine based interfaces - Aggregation of multiple DG units. Energy storage elements: Batteries, ultra-capacitors, flywheels

Reference Books:  

Course Outcomes:  
Upon completion of the course, the students will be able to
1. Understand the current scenario of Distributed Generation and the need to implement DG sources
2. Investigate the different types of interfaces for Grid integration of DGs.
3. Appraise the technical impacts of DGs upon transmission and distribution systems
4. Evaluate the various control aspects and techniques of different distributed generation sources.
5. Associate different types of micro-grids and analyze the transients and protection related issues in micro-grids.
Course Code : EE685
Course Title : CONTROL DESIGN TECHNIQUES FOR POWER ELECTRONIC SYSTEMS
Number of Credits : 3
Course Type : Elective

Course Objectives: The main objective of this course is to study the application of modern control theory to power electronic converters and drives

Prerequisites: Classical Control, Systems Theory, Power Converters

Review of basic control theory – control design techniques such as P, PI, PID and lead lag compensator design. Review of state space control design approach – state feedback controller and observer design.

Control of DC-DC converters. State space modeling of Buck, Buck-Boost, Cuk, Sepic, Zeta Converters. Equilibrium analysis and closed loop voltage regulations using state feedback controllers and sliding mode controllers.

Control of rectifiers. State space modeling of single phase and three phase rectifiers. State feedback controllers and observer design for output voltage regulation for nonlinear loads. Analysis of continuous and discontinuous mode of operation.

Modelling of Brushless DC motors and its speed regulations – State space model, sensorless speed control of BLDC motor and Sliding mode control design for BLDC motor. Modelling and control of switched reluctance motor.

Modelling of multi input DC-DC converters and its application to renewable energy. Output voltage regulation of Multi input DC-DC converter using state feedback controllers.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Recognize different control techniques and design of compensators, controllers and observers
2. Model and analyze various closed loop controllers
3. Design controllers for different rectifiers and to analyze various modes of operation
4. Model and design of various controllers for BLDC and Reluctance motors
Course Code : EE686
Course Title : ENERGY AUDITING AND MANAGEMENT
Number of Credits : 3
Course Type : Elective

Course Objectives:
- To emphasize the energy management on various electrical equipments and metering
- To illustrate the energy management in lighting systems and cogeneration
- To study the concepts behind the economic analysis and load management

Prerequisites: Electrical Machines, Transmission and Distribution of Electrical Energy, utilization of electrical energy

Basics of Energy – Need for energy management – energy accounting- energy monitoring, targeting and reporting-energy audit process

Energy management for electric motors – Transformer and reactors-capacitors and synchronous machines, energy management by cogeneration – forms of cogeneration – feasibility of cogeneration – electrical interconnection

Energy management in lighting systems – task and the working space - light sources – ballasts – lighting controls – optimizing lighting energy – power factor and effect of harmonics, lighting and energy standards

Metering for energy management – units of measure - utility meters – demand meters – paralleling of current transformers – instrument transformer burdens – multitasking solid state meters, metering location vs requirements, metering techniques and practical examples

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand the basics of Energy auditing and Energy management
2. Employ energy management strategies for electric machines and cogeneration
3. Employ energy management strategies in lighting systems
4. Devise energy management strategies for metering and instrumentation
5. Analyze and justify the economics of different energy management strategies
Course Code : EE687
Course Title : ELECTRIC AND HYBRID VEHICLES
Number of Credits : 3
Course Type : Elective

Course Objectives: This course introduces the fundamental concepts, principles, analysis and design of hybrid and electric vehicles.

Prerequisites: Power Conversion Techniques, Electrical Machines

History of hybrid and electric vehicles, social and environmental importance of hybrid and electric vehicles, impact of modern drive-trains on energy supplies. Basics of vehicle performance, vehicle power source characterization, transmission characteristics, mathematical models to describe vehicle performance.

Basic concept of hybrid traction, introduction to various hybrid drive-train topologies, power flow control in hybrid drive-train topologies, fuel efficiency analysis. Basic concepts of electric traction, introduction to various electric drive-train topologies, power flow control in hybrid drive-train topologies, fuel efficiency analysis.

Introduction to electric components used in hybrid and electric vehicles, Configuration and control of DC Motor drives, Configuration and control of Introduction Motor drives, configuration and control of Permanent Magnet Motor drives, Configuration and control of Switch Reluctance Motor drives, drive system efficiency.

Matching the electric machine and the internal combustion engine (ICE), Sizing the propulsion motor, sizing the power electronics, selecting the energy storage technology, Communications, supporting subsystems.

Introduction to energy management strategies used in hybrid and electric vehicle, classification of different energy management strategies, comparison of different energy management strategies, implementation issues of energy strategies.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to

1. Understand mathematical models, performance and characteristics of hybrid and electric vehicles.
2. Analyze the concepts, topologies and power flow control of electric traction systems
3. Appraise the configuration and control of various hybrid electric motor drives
4. Plan and design appropriate vehicle management system.
Course Code : EE688  
Course Title : PRINCIPLES OF VLSI DESIGN  
Number of Credits : 3  
Course Type : Elective

Course Objectives: Enables the student to get exposure on low power electronic system design and its application

Prerequisites: Digital Electronics, Electronic Circuits

MOS and Fabrication: VLSI technology- NMOS, CMOS and BICMOS circuit fabrication. Comparison of IC technologies. Operation characteristics, design equations, models and second order effects of MOS transistors, Fabrication of resistors and capacitors. Latch up, Driver circuits.

Hardware Description languages: VHDL- Modeling styles –Design of simple/ complex circuits using VHDL. Overview of Verilog HDL -Design of simple circuits using Verilog HDL.

CMOS Logic Circuits: Implementation of logic circuits using MOS and CMOS, Pass transistor and transmission gates , design of combinational and sequential circuits – memory design.

Programmable Devices: Simple and Complex Programmable logic devices (SPLD and CPLDs), Field Programmable Gate Arrays (FPGAs), Internal components of FPGA, Case study: A CPLD and a 10 million gates type of FPGA.

ASIC: Types of ASICs-Design flow-Programmable ASICs-Programmable ASIC logic cells and interconnect for Xilinx and Altera families.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand the concepts and characteristics of MOS devices.
2. Model the system using Hardware Description languages.
3. Design the CMOS logic circuits and memory units.
4. acquire knowledge on PLDS.
5. Appraise the possibilities of ASIC design.
Course Code : EE689
Course Title : ADVANCED TOPICS IN POWER ELECTRONICS
Number of Credits : 3
Course Type : Elective

Course Objectives:
To give an introduction to the recent developments of power electronics from components, topology, control techniques to thermal & EMC. This course drives on the application requirements of power electronics. This is a higher level of subject that will help to work in demanding areas of power electronics

Prerequisites:
Power Electronics course in UG with knowledge on Basics of semiconductor switches, Basics of converter topology (AC-DC, AC-AC & DC-DC), basic control techniques of Power Electronic Equipment, Basics of reactive elements, storage and high frequency magnetic, Basics of EMC & any power simulation environment

Introduction to switches - Advanced Silicon devices - Silicon HV thyristors, MCT, BRT & EST. SiC devices - diodes, thyristors, JFETs & IGBTs. Gallium nitrate devices - Diodes, MoSFETs

Advance converter topologies for PEE - Interleaved converters, Z-Source converters, Multi level converters (Cascaded H-Bridge, Diode clamped, NPC, Flying capacitor) Multi pulse PWM current source converters, Advanced drive control schemes.

Advances in reactive elements - Advanced magnetic material, technology and design (Powder ferrite, Amorphous, Planar designs) Advance capacitive designs (Multilayer chip capacitors, double layers for storage, Aluminum electrolytic)

Advance storage systems - Developments in battery systems, Ultra capacitors, Fly wheel energy storage, Hybrid storage systems for EV/HEV, Power management in hybrid systems, Energy storage in renewable.

Thermal engineering with EMI/EMC techniques - Advanced thermal solutions (fan cooled, liquid cooled, heat pipes, hybrid techniques) EMC techniques (Conducted, Radiated emissions & Susceptibility), System design for EMC.

References Books:
2. R D MiddleBrook & Slobodan CUK, 'Advances in Switched Mode Power Conversion', Vol I, II, & III, Tesla Co (optimum power conversion)
Course Outcomes:
 Upon completion of the course, the students will be able to
 1. Understand the principles of operation of advanced Silicon devices
 2. Appraise various advanced converter topologies and the suitable control schemes
 3. Recognize recent developments in design aspects of reactive elements such as the material, the structure etc and the effect on performance
 4. Understand nuances of advanced energy storage systems such as battery energy storage system (BESS), ultra capacitors, etc and strategies for power management in such systems
 5. Distinguish between various possible solutions pertaining to thermal management and EMI/EMC problems and devise solutions for simple power electronic systems
Course Code : EE690
Course Title : DESIGN TECHNIQUES FOR SMPS
Number of Credits : 3
Course Type : Elective

To give a practical step by step approach for design and assembly of Power Supplies and apply the necessary recent technology to comply the standards and certification requirements.

Prerequisites:
- Power Electronics course in UG with knowledge on Basics of semiconductors, Basics of Power supplies-LPS & SMPS, Basic topologies in SMPC, Control of power semiconductors, Basics of high frequency magnetic, Basics of EMC &any power simulation environment.

Introduction of Available Sources & demanding loads:
- Sources-AC mains, Lab supplies, Batteries, Solar Cells Loads - Requirements of load, battery as load, Selection of Topology :Step-Up/Step-Down, Multiple outputs, Continuous & discontinuous modes of operation, Isolated converters, Various configurations of Converters, Selection of Components: Selection of Resistors, Chokes, Capacitors, Diodes, MoFETs & IGBTs, Connectors,DesignofMagneticsFundamentals&idealconditions,designofHigh frequency chokes & transformers, Selection of wire gauge, sealing of magnetic.

Guide to Instrumentation:
- Basics of measurements using DMM, Oscilloscope, Electronic loads, etc Design of Magnetics Fundamentals & ideal conditions, design of High frequency chokes & transformers, Selection of wire gauge, sealing of magnetics Design of Feedback circuits Basic control requirements, Current &voltage mode control fundamentals& system stability conditions Design of Control and Monitoring circuits Practical Control circuitry & Monitoring circuitry requirements.

Evaluations and Thermal management
- Performance evaluations of SMPS& thermal loss calculations and cooling options & packaging of converter EMI control requirements Overview of EMC, differentiating signal and noise, Layout concepts Low & High frequency filtering requirements, Optimal filter design Worst case analysis Introduction to datasheet reading, operation tuned to datasheet, typical worst case analysis.

Standards governing the power supplies IEC standards for Electrical &Environmental testing, certification standards, Ingress protection standards
- Recent trend in Power supplies Recent advancements in components, Recent advancements in topologies, Digital control of power supplies, Power Integration &its Low power applications.

Analysis and Simulation using PSIM:BUCK,BOOST&BUCK, BOOST, Typical discrete power factor corrector circuit

Reference Books:
Course Outcomes:
Upon completion of the course, the students will be able to
1. Choose appropriate components and configure various converter topologies.
2. Design various control, monitoring and measurement circuitry for Switched Mode Power Supplies
3. Evaluate thermal performance of SMPS units and design appropriate filters
4. Appreciate standards and recent advancements related to SMPS.
5. Analyze and simulate the various converter topologies using PSIM.

**Course Objectives:**
To emphasize basic physics, chemistry, and engineering issues of energy storage devices, such as batteries, thermoelectric convertors, fuel cells, super capacitors.

**Prerequisites:**
Fundamental Chemistry and Material Science

**Prospect for both traditional and renewable energy sources** - detailed analysis of Indian energy market and future need through 2020 - energy, economic growth and the environment, implications of the Kyoto Protocol, and structural change in the electricity supply industry

Batteries - performance, charging and discharging, storage density, energy density, and safety issues, classical batteries - Lead Acid, Nickel-Cadmium, Zinc Manganese dioxide, and modern batteries - Zinc-Air, Nickel Hydride, Lithium Battery.

Thermoelectric - electron conductor and phonon glass, classical thermoelectric materials (i) four-probe resistivity measurement, Seebeck coefficient measurement, and thermal conductivity measurement.

Super capacitors - types of electrodes and some electrolytes, Electrode materials - high surface area activated carbons, metal oxide, and conducting polymers, Electrolyte - aqueous or organic, disadvantages and advantages of super capacitors - compared to battery systems, applications - transport vehicles, private vehicles, and consumer electronics - energy density, power density, price, and market.

Fuel cells - direct energy conversion - maximum intrinsic efficiency of an electrochemical converter, physical interpretation - carnot efficiency factor in electrochemical energy convertors, types of fuel cells - hydrogen oxygen cells, hydrogen air cell, alkaline fuel cell, and phosphoric fuel cell.

**Reference Books:**

**Course Outcomes:**
Upon completion of the course, the students will be able to
1. Recognize various issues related to energy market, its growth and its structural implications in India.
2. Analyze the performance of different battery storage systems.
3. Employ different thermoelectric measurement techniques appropriately.
4. Interpret the applications of supercapacitors for appropriate storage systems.
5. Understand and differentiate different types of fuel cells.
Course Code : EE692
Course Title : DIGITAL SIMULATION OF POWER ELECTRONIC SYSTEMS
Number of Credits : 3
Course Type : Elective

Course Objectives: To provide knowledge on modeling and simulation of power simulation circuits and systems

Prerequisites: Knowledge in Power Electronics and machines.

State space modeling and simulation of linear systems. Introduction to electrical machine modeling: induction, DC, and synchronous machines, simulation of basic electric drives, stability aspects.

Simulation of single phase and three phase uncontrolled and controlled (SCR) rectifiers, converters with self commutated devices- simulation of power factor correction schemes, Simulation of converter fed dc motor drives ,Simulation of thyristor choppers with voltage, current and load commutation schemes, Simulation of chopper fed dc motor.

Simulation of single and three phase inverters with thyristors and self-commutated devices, Space vector representation, pulse-width modulation methods for voltage control, waveform control. Simulation of inverter fed induction motor drives.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. To develop algorithm and software models for power electronics and drives applications
2. To analyze the transient and steady performance of the designed models.
3. To choose suitable devices or models for appropriate applications
Course Code : EE693  
Course Title : PWM CONVERTERS AND APPLICATIONS  
Number of Credits : 3  
Course Type : Elective

Course Objectives:
- To understand the concepts and basic operation of PWM converters, including basic circuit operation and design.
- To understand the steady-state and dynamic analysis of PWM converters along with the applications like solid state drives and power quality.

Prerequisites:
Power Converters

AC/DC and DC/AC power conversion, overview of applications of voltage source converters, pulse modulation techniques for bridge converters.

Bus clamping PWM, space vector based PWM, advanced PWM techniques, practical devices in converter; calculation of switching and conduction losses.

Compensation for dead time and DC voltage regulation; dynamic model of a PWM converter, multilevel converters; constant V/F induction motor drives.

Estimation of current ripple and torque ripple in inverter fed drives; line – side converters with power factor compensation.

Active power filtering, reactive power compensation; harmonic current compensation.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand the basic operations of various PWM techniques for Power Converters.
2. Steady-State and transient modelling and analysis of power converters with various PWM techniques.
3. Analysis and Design of Control Loops for PWM power converters along with the applications like solid state drives and power quality.
Course Code : EE694  
Course Title : EMBEDDED SYSTEM DESIGN  
Number of Credits : 3  
Course Type : Elective

Course Objectives: To enable the learner to understand the concepts of embedded processors with its application.

Prerequisites: Digital Systems, Microprocessors/Microcontrollers.

Embedded System Architectures—ARM processor and SHARC processor-architectural design—memory organization—data operation—bus configurations. System on-chip, scalable bus architectures, Design example: Alarm clock, hybrid architectures.

Sensor and Actuator I/O—ADC, DAC, timers, Servos, Relays, stepper motors, H-Bridge, CODECs, FPGA, ASIC, diagnostic port.

Real time operating systems(RTOS)—real time kernel—OS tasks—task states—task scheduling—interrupt processing—clocking communication and synchronization—control blocks—memory requirements and control—kernel services.

Embedded Networks—Distributed Embedded Architecture—Hardware and Software Architectures, Networks for embedded systems—I2C, CANBus, Ethernet, Internet, Network Based design—Communication Analysis, System Performance Analysis, Hardware Platform design, Allocation and scheduling, Design Example: Elevator Controller.

System Design—Specification, Requirements and Architectural design of PBX systems, Set-top box, Personal digital Assistants.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand the architecture of ARM and SHARC processors
2. Explore the possible peripherals with the processor
3. Acquire the knowledge of requirements of the real time OS.
4. Appraise the embedded networks
5. Apply the concepts and understand the applications.
Course Code: EE695
Course Title: DIGITAL CONTROL SYSTEMS
Number of Credits: 3
Course Type: Elective

Course Objectives: This course gives an idea about designing digital controllers, which are feasible to implement in digital computers, using both classical and modern techniques.

Prerequisites: Classical control, modern control

Introduction to Discrete time systems - Analogies with continuous-time systems, mathematical models for LTI discrete-time systems, convolution representation and difference equations in advanced and delayed form, Z-transformation, analysis of first, second, and higher order systems, stability of discrete-time systems, the Jury’s criterion.

Modeling of Sampled Data Systems - Sampled Data System; Models of Continuous Time Systems; Naturally Occurring Discrete Time Systems; Discretization of Continuous Time Systems; Approaches to Controller Design and Testing.

Transfer Function Approach to Controller Design - Structures and Specifications-Control Structures, Proportional Control, Other Popular Controllers; Proportional, Integral, Derivative Controllers-Discretization Techniques, Discretization of PID Controllers; Pole Placement Controllers-Pole Placement Controller with Performance Specifications, PID Tuning Through Pole Placement Control, Special Cases of Pole Placement Control; Minimum Variance Control-Generalized Minimum Variance Controller; Model Predictive Control-Generalized Predictive Control; Linear Quadratic Gaussian Control.

Reference Books:

Course Outcomes:
Upon completion of the course, the students will be able to
1. Understand the difference between continuous time controller and discrete time controllers
2. Design of digital controllers
3. Implementation based on various applications
Course Code : EE696
Course Title : POWER SYSTEM AUTOMATION
Number of Credits : 3
Course Type : Elective

Course Objectives: To familiarize the students with the basics of Power System Automation, Building blocks, Supervisory Control And Data Acquisition(SCADA) System, Remote Terminal Units(RTU), Master Stations etc.

Prerequisites: Basic Knowledge of Transmission & Distribution systems and Measuring Instruments

Evolution of Automation systems, History of Power system Automation, Supervisory Control And Data Acquisition(SCADA) Systems, Components of SCADA systems, SCADA Applications, SCADA in power systems, SCADA basic functions, SCADA application functions in Generation, Transmission and Distribution.

Advantages of SCADA in Power Systems, The Power system 'Field', Types of data & signals in the Power system, Flow of Data from the field to the SCADA Control center. Building blocks of SCADA systems, Classification of SCADA systems.

Remote Terminal Unit (RTU), Evolution of RTUs, Components of RTU, Communication, Logic, Termination and Test/HMI Subsystems, Power supplies, Advanced RTU Functionalities.

Intelligent Electronic Devices (IEDs), Evolution of IEDs, IED functional block diagram, The hardware and software architecture of IED, IED Communication subsystem, IED advanced functionalities, Typical IEDs, Data Concentrators and Merging Units, SCADA Communication Systems.

Master Station, Master station software and hardware configurations, Server systems in the master station, Small, medium and large master station configurations, Global Positioning Systems, Master station performance, Human Machine Interface (HMI), HMI components, Software functionalities, Situational awareness, Case studies in SCADA.

Reference Books:
2. Electric Power Substation Engineering John D. Mc Donald CRC Press, Taylor and Francis
5. Related Research papers.

Course Outcomes:
Upon completion of the course, the students will be able to

1. Understand the concepts of power system automation.
2. Understand the components of SCADA systems.
3. Comprehend the RTU, IED and other components of automation systems
4. Understand the transfer of signals from the field to an operator control terminal.
5. Design an interoperable powers automation system.
